**Lepton Family number (LF), Lepton number (L),  
or Baryon number (B) violating modes**

*L* means lepton number violation (e.g.  $\tau^- \rightarrow e^+ \pi^- \pi^-$ ). Following common usage, *LF* means lepton family violation *and not* lepton number violation (e.g.  $\tau^- \rightarrow e^- \pi^+ \pi^-$ ). *B* means baryon number violation.

$e^- \gamma$	LF	$< 1.1$	$\times 10^{-7}$	CL=90%	888
$\mu^- \gamma$	LF	$< 6.8$	$\times 10^{-8}$	CL=90%	885

## Heavy Charged Lepton Searches

### $L^\pm$ – charged lepton

Mass  $m > 100.8$  GeV, CL = 95% <sup>[h]</sup> Decay to  $\nu W$ .

### $L^\pm$ – stable charged heavy lepton

Mass  $m > 102.6$  GeV, CL = 95%

## Neutrino Properties

See the note on “Neutrino properties listings” in the Particle Listings.

Mass  $m < 2 \text{ eV}$  (tritium decay)

Mean life/mass,  $\tau/m > 300 \text{ s/eV}$ , CL = 90% (reactor)

Mean life/mass,  $\tau/m > 7 \times 10^9 \text{ s/eV}$  (solar)

Mean life/mass,  $\tau/m > 15.4 \text{ s/eV}$ , CL = 90% (accelerator)

Magnetic moment  $\mu < 0.9 \times 10^{-10} \mu_B$ , CL = 90% (reactor)

## Number of Neutrino Types

Number  $N = 2.994 \pm 0.012$  (Standard Model fits to LEP data)

Number  $N = 2.93 \pm 0.05$  ( $S = 1.2$ ) (Direct measurement of invisible  $Z$  width)

## Neutrino Mixing

The following values are obtained through data analyses based on the 3-neutrino mixing scheme described in the review “Neutrino mass, mixing, and flavor change” by B. Kayser in this *Review*.

$$\sin^2(2\theta_{12}) = 0.86^{+0.03}_{-0.04}$$

$$\Delta m_{21}^2 = (8.0^{+0.4}_{-0.3}) \times 10^{-5} \text{ eV}^2$$

The ranges below for  $\sin^2(2\theta_{23})$  and  $\Delta m_{32}^2$  correspond to the projections onto the appropriate axes of the 90% CL contours in the  $\sin^2(2\theta_{23})$ - $\Delta m_{32}^2$  plane.

$$\sin^2(2\theta_{23}) > 0.92$$

$$\Delta m_{32}^2 = 1.9 \text{ to } 3.0 \times 10^{-3} \text{ eV}^2 [i]$$

$$\sin^2(2\theta_{13}) < 0.19, \text{ CL} = 90\%$$

## Heavy Neutral Leptons, Searches for

For excited leptons, see Compositeness Limits below.

### Stable Neutral Heavy Lepton Mass Limits

Mass  $m > 45.0$  GeV, CL = 95% (Dirac)

Mass  $m > 39.5$  GeV, CL = 95% (Majorana)

### Neutral Heavy Lepton Mass Limits

Mass  $m > 90.3$  GeV, CL = 95%

(Dirac  $\nu_L$  coupling to  $e, \mu, \tau$ ; conservative case( $\tau$ ))

Mass  $m > 80.5$  GeV, CL = 95%

(Majorana  $\nu_L$  coupling to  $e, \mu, \tau$ ; conservative case( $\tau$ ))

---

### NOTES

- [a] This is the best limit for the mode  $e^- \rightarrow \nu\gamma$ . The best limit for “electron disappearance” is  $6.4 \times 10^{24}$  yr.
- [b] See the “Note on Muon Decay Parameters” in the  $\mu$  Particle Listings for definitions and details.
- [c]  $P_\mu$  is the longitudinal polarization of the muon from pion decay. In standard  $V-A$  theory,  $P_\mu = 1$  and  $\rho = \delta = 3/4$ .
- [d] This only includes events with the  $\gamma$  energy  $> 10$  MeV. Since the  $e^- \bar{\nu}_e \nu_\mu$  and  $e^- \bar{\nu}_e \nu_\mu \gamma$  modes cannot be clearly separated, we regard the latter mode as a subset of the former.
- [e] See the relevant Particle Listings for the energy limits used in this measurement.
- [f] A test of additive vs. multiplicative lepton family number conservation.
- [g] Basis mode for the  $\tau$ .
- [h]  $L^\pm$  mass limit depends on decay assumptions; see the Full Listings.
- [i] The sign of  $\Delta m_{32}^2$  is not known at this time. The range quoted is for the absolute value.
