**DESCRIPTION AND RATING**

The 5670 is a miniature medium-mu twin triode each section of which has a separate cathode connection. The tube is suited for use in a wide-variety of general-purpose amplifier and mixer circuits as well as numerous multivibrator and oscillator applications. The useful operating range extends from low frequencies through the VHF region.

The 5670 is a special-quality tube intended for use in critical industrial and military applications in which operational dependability is of primary importance. Features of the tube include a high degree of mechanical strength and a heater-cathode construction capable of withstanding many-thousand cycles of intermittent operation. When used in on-off control applications, the tube will maintain its emission capabilities after long periods of operation under cutoff conditions.

Analysis of the electrical characteristics of this tube with those of the 2C51 will indicate that the 5670 is essentially similar.

The indicated 500-hour and 1000-hour values are life-test end points for the following conditions of operation for each section:  $E_f = 6.3$  volts,  $E_b = 150$  volts,  $R_k = 240$  ohms,  $R_g = 0.5$  meg,  $E_{hk} = 135$  volts with heater positive with respect to cathode, and bulb temperature = 165 C minimum.

**SPECIAL TESTS AND RATINGS****Stability Life Test**

Statistical sample operated for one hour to evaluate and control initial variations in transconductance.

**Survival Rate Life Test**

Statistical sample operated for one hundred hours to evaluate and control early-life electrical and mechanical inoperatives.

**Heater-Cycling Life Test**

Statistical sample operated for 2000 cycles to evaluate and control heater-cathode defects. Conditions of test include  $E_f = 7.5$  volts cycled for one minute on and one minute off,  $E_b = E_c = 0$  volts, and  $E_{hk} = 135$  volts with heater positive with respect to cathode.

**Shock Rating—600 G**

Statistical sample subjected to five impact accelerations of 600 G in each of four different positions. The accelerating forces are applied by the Navy-type, High Impact (flyweight) Shock Machine for Electronic Devices or its equivalent.

**Fatigue Rating—2.5 G**

Statistical sample subjected to vibrational acceleration of 2.5 G for 32 hours minimum in each of three different positions. The sinusoidal vibration is applied at a fixed frequency between 25 and 60 cycles per second.

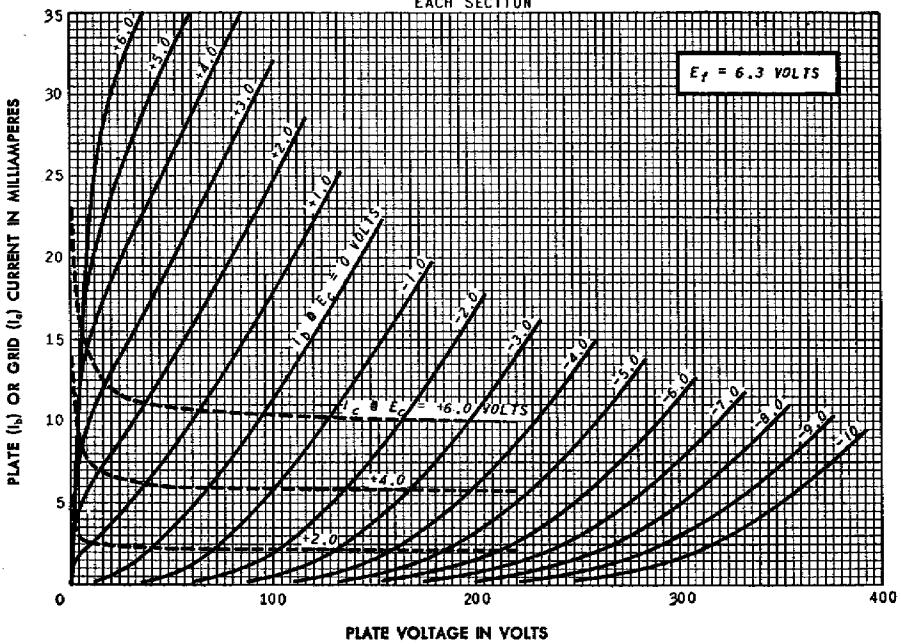

**Altitude Rating—60,000 Feet**

Statistical sample subjected to pressure of 55 millimeters of mercury to evaluate and control arcing and corona.

**Note:** The conditions for some of the indicated tests have deliberately been selected to aggravate tube failures for test and evaluation purposes. In no sense should these conditions be interpreted as suitable circuit operating conditions.

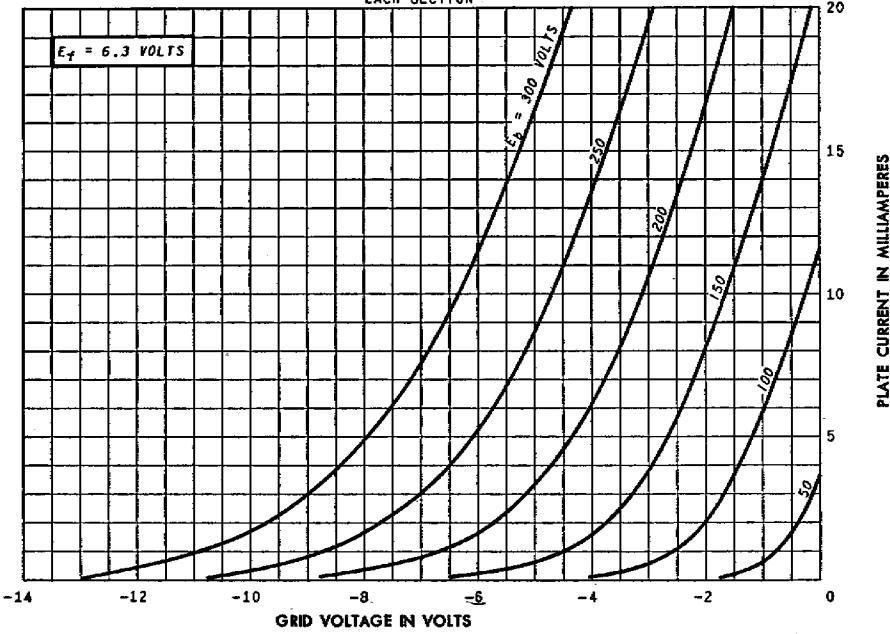

In the design of military equipment employing this tube, reference should be made to the appropriate MIL-E-1C specification.
