Any application in the broadcast chain may alter the data within the intent. This malicious application is altering the URL to point to an attack site:

Example Language: Java

(attack)

```
public class CallReceiver extends BroadcastReceiver {
    @Override
    public void onReceive(Context context, Intent intent) {
        String url = intent.getStringExtra(Intent.URL_TO_OPEN);
        attackURL = "www.example.com/attack?" + url;
        setResultData(attackURL);
    }
}
```

The final receiving application will then open the attack URL. Where possible, send intents to specific trusted applications instead of using a broadcast chain.

Example 4:

This application sends a special intent with a flag that allows the receiving application to read a data file for backup purposes.

Example Language: Java

(bad)

```
Intent intent = new Intent();
intent.setAction("com.example.BackupUserData");
intent.setData(file_uri);
intent.addFlags(FLAG_GRANT_READ_URI_PERMISSION);
```

```
sendBroadcast(intent);
```

Example Language: Java

(attack)

```
public class CallReceiver extends BroadcastReceiver {
    @Override
    public void onReceive(Context context, Intent intent) {
        Uri userData = intent.getData();
        stealUserData(userData);
    }
}
```

Any malicious application can register to receive this intent. Because of the FLAG_GRANT_READ_URI_PERMISSION included with the intent, the malicious receiver code can read the user's data.

Notes

Maintenance

This entry will be made more comprehensive in later CWE versions.

CWE-939: Improper Authorization in Handler for Custom URL Scheme

Weakness ID : 939

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The software uses a handler for a custom URL scheme, but it does not properly restrict which actors can invoke the handler using the scheme.

Extended Description

Mobile platforms and other architectures allow the use of custom URL schemes to facilitate communication between applications. In the case of iOS, this is the only method to do inter-application communication. The implementation is at the developer's discretion which may open security flaws in the application. An example could be potentially dangerous functionality such as modifying files through a custom URL scheme.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf		862	Missing Authorization	1583

Relevant to the view "Architectural Concepts" (CWE-1008)

Nature	Type	ID	Name	Page
MemberOf		1011	Authorize Actors	1865

Relevant to the view "Development Concepts" (CWE-699)

Nature	Type	ID	Name	Page
ChildOf		862	Missing Authorization	1583

Applicable Platforms

Paradigm : Mobile (*Prevalence = Undetermined*)

Potential Mitigations

Phase: Architecture and Design

Utilize a user prompt pop-up to authorize potentially harmful actions such as those modifying data or dealing with sensitive information. When designing functionality of actions in the URL scheme, consider whether the action should be accessible to all mobile applications, or if a whitelist of applications to interface with is appropriate.

Demonstrative Examples

Example 1:

This iOS application uses a custom URL scheme. The `replaceFileText` action in the URL scheme allows an external application to interface with the file `incomingMessage.txt` and replace the contents with the text field of the query string.

External Application

Example Language: Objective-C

(good)

```
NSString *stringURL = @"appscheme://replaceFileText?file=incomingMessage.txt&text=hello";
NSURL *url = [NSURL URLWithString:stringURL];
[[UIApplication sharedApplication] openURL:url];
```

Application URL Handler

Example Language:

(bad)

```
- (BOOL)application:(UIApplication *)application handleOpenURL:(NSURL *)url {
    if (!url) {
        return NO;
    }
    NSString *action = [url host];
    if([action isEqualToString: @"replaceFileText"]) {
        NSDictionary *dict = [self parseQueryStringExampleFunction:[url query]];
        //this function will write contents to a specified file
        FileObject *objectFile = [self writeToFile:[dict objectForKey: @"file"] withText:[dict objectForKey: @"text"]];
    }
    return YES;
}
```

The handler has no restriction on who can use its functionality. The handler can be invoked using any method that invokes the URL handler such as the following malicious iframe embedded on a web page opened by Safari.

Example Language: HTML

(attack)

```
<iframe src="appscheme://replaceFileText?file=Bookmarks.dat&text=listOfMaliciousWebsites">
```

The attacker can host a malicious website containing the iframe and trick users into going to the site via a crafted phishing email. Since Safari automatically executes iframes, the user is not prompted when the handler executes the iframe code which automatically invokes the URL

handler replacing the bookmarks file with a list of malicious websites. Since `replaceFileText` is a potentially dangerous action, an action that modifies data, there should be a sanity check before the `writeToFile:withText:` function.

Example 2:

These Android and iOS applications intercept URL loading and perform special actions if a particular URL scheme is used, thus allowing the Javascript within the WebView to communicate with the application:

Example Language: Java

(bad)

```
@Override
public boolean shouldOverrideUrlLoading(WebView view, String url){
    if (url.substring(0,14).equalsIgnoreCase("examplescheme:")){
        if (url.substring(14,25).equalsIgnoreCase("getUserInfo")){
            writeToView(view, UserData);
            return false;
        }
        else{
            return true;
        }
    }
}
```

Example Language: Objective-C

(bad)

```
-(BOOL) webView:(UIWebView *)exWebView shouldStartLoadWithRequest:(NSURLRequest *)exRequest navigationType:
(UIWebViewNavigationType)exNavigationType
{
    NSURL *URL = [exRequest URL];
    if ([[URL scheme] isEqualToString:@"exampleScheme"])
    {
        NSString *functionString = [URL resourceSpecifier];
        if ([functionString hasPrefix:@"specialFunction"])
        {
            // Make data available back in webview.
            UIWebView *webView = [self writeToView:[URL query]];
        }
        return NO;
    }
    return YES;
}
```

A call into native code can then be initiated by passing parameters within the URL:

Example Language: JavaScript

(attack)

```
window.location = examplescheme://method?parameter=value
```

Because the application does not check the source, a malicious website loaded within this WebView has the same access to the API as a trusted site.

Observed Examples

Reference	Description
CVE-2013-5725	URL scheme has action <code>replace</code> which requires no user prompt and allows remote attackers to perform undesired actions. https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-5725
CVE-2013-5726	URL scheme has action <code>follow</code> and <code>favorite</code> which allows remote attackers to force user to perform undesired actions. https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-5726

References

CWE-940: Improper Verification of Source of a Communication Channel

Weakness ID : 940

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The software establishes a communication channel to handle an incoming request that has been initiated by an actor, but it does not properly verify that the request is coming from the expected origin.

Extended Description

When an attacker can successfully establish a communication channel from an untrusted origin, the attacker may be able to gain privileges and access unexpected functionality.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf		923	Improper Restriction of Communication Channel to Intended Endpoints	1621

Relevant to the view "Architectural Concepts" (CWE-1008)

Nature	Type	ID	Name	Page
MemberOf		1014	Identify Actors	1869

Relevant to the view "Development Concepts" (CWE-699)

Nature	Type	ID	Name	Page
ChildOf		923	Improper Restriction of Communication Channel to Intended Endpoints	1621

Applicable Platforms

Language : Language-Independent (*Prevalence = Undetermined*)

Paradigm : Mobile (*Prevalence = Undetermined*)

Common Consequences

Scope	Impact	Likelihood
Access Control	Gain Privileges or Assume Identity	
Other	Varies by Context	
<i>An attacker can access any functionality that is inadvertently accessible to the source.</i>		

Potential Mitigations

Phase: Architecture and Design

Use a mechanism that can validate the identity of the source, such as a certificate, and validate the integrity of data to ensure that it cannot be modified in transit using a man-in-the-middle attack. When designing functionality of actions in the URL scheme, consider whether the action

should be accessible to all mobile applications, or if a whitelist of applications to interface with is appropriate.

Demonstrative Examples

Example 1:

This Android application will remove a user account when it receives an intent to do so:

Example Language: Java

(bad)

```
IntentFilter filter = new IntentFilter("com.example.RemoveUser");
MyReceiver receiver = new MyReceiver();
registerReceiver(receiver, filter);
public class DeleteReceiver extends BroadcastReceiver {
    @Override
    public void onReceive(Context context, Intent intent) {
        int userID = intent.getIntExtra("userID");
        destroyUserData(userID);
    }
}
```

This application does not check the origin of the intent, thus allowing any malicious application to remove a user. Always check the origin of an intent, or create a whitelist of trusted applications using the manifest.xml file.

Example 2:

These Android and iOS applications intercept URL loading within a WebView and perform special actions if a particular URL scheme is used, thus allowing the Javascript within the WebView to communicate with the application:

Example Language: Java

(bad)

```
// Android
@Override
public boolean shouldOverrideUrlLoading(WebView view, String url){
    if (url.substring(0,14).equalsIgnoreCase("examplescheme:")){
        if(url.substring(14,25).equalsIgnoreCase("getUserInfo")){
            writeToView(view, UserData);
            return false;
        }
        else{
            return true;
        }
    }
}
```

Example Language: Objective-C

(bad)

```
// iOS
-(BOOL) webView:(UIWebView *)exWebView shouldStartLoadWithRequest:(NSURLRequest *)exRequest navigationType:
(UIWebViewNavigationType)exNavigationType
{
    NSURL *URL = [exRequest URL];
    if ([[URL scheme] isEqualToString:@"exampleScheme"])
    {
        NSString *functionString = [URL resourceSpecifier];
        if ([functionString hasPrefix:@"specialFunction"])
        {
            // Make data available back in webview.
            UIWebView *webView = [self writeToView:[URL query]];
        }
        return NO;
    }
    return YES;
}
```

A call into native code can then be initiated by passing parameters within the URL:

Example Language: JavaScript

(attack)

```
window.location = examplescheme://method?parameter=value
```

Because the application does not check the source, a malicious website loaded within this WebView has the same access to the API as a trusted site.

Observed Examples

Reference	Description
CVE-2000-1218	DNS server can accept DNS updates from hosts that it did not query, leading to cache poisoning https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2000-1218
CVE-2005-0877	DNS server can accept DNS updates from hosts that it did not query, leading to cache poisoning https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-0877
CVE-2001-1452	DNS server caches glue records received from non-delegated name servers https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2001-1452

Notes

Relationship

While many access control issues involve authenticating the user, this weakness is more about authenticating the actual source of the communication channel itself; there might not be any "user" in such cases.

CWE-941: Incorrectly Specified Destination in a Communication Channel

Weakness ID : 941

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The software creates a communication channel to initiate an outgoing request to an actor, but it does not correctly specify the intended destination for that actor.

Extended Description

Attackers at the destination may be able to spoof trusted servers to steal data or cause a denial of service.

There are at least two distinct weaknesses that can cause the software to communicate with an unintended destination:

- If the software allows an attacker to control which destination is specified, then the attacker can cause it to connect to an untrusted or malicious destination. For example, because UDP is a connectionless protocol, UDP packets can be spoofed by specifying a false source address in the packet; when the server receives the packet and sends a reply, it will specify a destination by using the source of the incoming packet - i.e., the false source. The server can then be tricked into sending traffic to the wrong host, which is effective for hiding the real source of an attack and for conducting a distributed denial of service (DDoS). As another example, server-side request forgery (SSRF) and XML External Entity (XXE) can be used to trick a server into making outgoing requests to hosts that cannot be directly accessed by the attacker due to firewall restrictions.
- If the software incorrectly specifies the destination, then an attacker who can control this destination might be able to spoof trusted servers. While the most common occurrence is likely due to misconfiguration by an administrator, this can be resultant from other weaknesses. For example, the software might incorrectly parse an e-mail or IP address and send sensitive data to an unintended destination. As another example, an Android application may use a "sticky broadcast" to communicate with a receiver for a particular application, but since sticky broadcasts can be processed by *any* receiver, this can allow a malicious application to access restricted data that was only intended for a different application.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf		923	Improper Restriction of Communication Channel to Intended Endpoints	1621
CanPrecede		406	Insufficient Control of Network Message Volume (Network Amplification)	892

Relevant to the view "Architectural Concepts" (CWE-1008)

Nature	Type	ID	Name	Page
MemberOf		1014	Identify Actors	1869

Relevant to the view "Development Concepts" (CWE-699)

Nature	Type	ID	Name	Page
ChildOf		923	Improper Restriction of Communication Channel to Intended Endpoints	1621

Applicable Platforms

Language : Language-Independent (*Prevalence = Undetermined*)

Paradigm : Mobile (*Prevalence = Undetermined*)

Demonstrative Examples

Example 1:

This code listens on a port for DNS requests and sends the result to the requesting address.

Example Language: Python

(bad)

```
sock = socket.socket(socket.AF_INET, socket.SOCK_DGRAM)
sock.bind( (UDP_IP,UDP_PORT) )
while true:
    data = sock.recvfrom(1024)
```

```

if not data:
    break
(requestIP, nameToResolve) = parseUDPpacket(data)
record = resolveName(nameToResolve)
sendResponse(requestIP,record)

```

This code sends a DNS record to a requesting IP address. UDP allows the source IP address to be easily changed ('spoofed'), thus allowing an attacker to redirect responses to a target, which may be then be overwhelmed by the network traffic.

Observed Examples

Reference	Description
CVE-2013-5211	composite: NTP feature generates large responses (high amplification factor) with spoofed UDP source addresses. https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-5211
CVE-1999-0513	Classic "Smurf" attack, using spoofed ICMP packets to broadcast addresses. https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-1999-0513
CVE-1999-1379	DNS query with spoofed source address causes more traffic to be returned to spoofed address than was sent by the attacker. https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-1999-1379

Notes

Maintenance

This entry will be made more comprehensive in later CWE versions.

CWE-942: Overly Permissive Cross-domain Whitelist

Weakness ID : 942

Status: Incomplete

Structure : Simple

Abstraction : Variant

Description

The software uses a cross-domain policy file that includes domains that should not be trusted.

Extended Description

A cross-domain policy file ("crossdomain.xml" in Flash and "clientaccesspolicy.xml" in Silverlight) defines a whitelist of domains from which a server is allowed to make cross-domain requests. When making a cross-domain request, the Flash or Silverlight client will first look for the policy file on the target server. If it is found, and the domain hosting the application is explicitly allowed to make requests, the request is made.

Therefore, if a cross-domain policy file includes domains that should not be trusted, such as when using wildcards, then the application could be attacked by these untrusted domains.

An overly permissive policy file allows many of the same attacks seen in Cross-Site Scripting (CWE-79). Once the user has executed a malicious Flash or Silverlight application, they are vulnerable to a variety of attacks. The attacker could transfer private information, such as cookies that may include session information, from the victim's machine to the attacker. The attacker could

send malicious requests to a web site on behalf of the victim, which could be especially dangerous to the site if the victim has administrator privileges to manage that site.

In many cases, the attack can be launched without the victim even being aware of it.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	B	183	Permissive Whitelist	433
ChildOf	C	284	Improper Access Control	626
CanPrecede	C	668	Exposure of Resource to Wrong Sphere	1316

Relevant to the view "Architectural Concepts" (CWE-1008)

Nature	Type	ID	Name	Page
MemberOf	C	1011	Authorize Actors	1865

Relevant to the view "Development Concepts" (CWE-699)

Nature	Type	ID	Name	Page
ChildOf	C	284	Improper Access Control	626

Applicable Platforms

Language : Language-Independent (*Prevalence = Undetermined*)

Paradigm : Web Based (*Prevalence = Undetermined*)

Common Consequences

Scope	Impact	Likelihood
Confidentiality	Execute Unauthorized Code or Commands	
Integrity	Bypass Protection Mechanism	
Availability	Read Application Data	
Access Control	Varies by Context	
<p><i>An attacker may be able to bypass the web browser's same-origin policy. An attacker can exploit the weakness to manipulate or steal cookies, create requests that can be mistaken for those of a valid user, compromise confidential information, or execute malicious code on the end user systems for a variety of nefarious purposes. Other damaging attacks include the disclosure of end user files, installation of Trojan horse programs, redirecting the user to some other page or site, running ActiveX controls (under Microsoft Internet Explorer) from sites that a user perceives as trustworthy, and modifying presentation of content.</i></p>		

Potential Mitigations

Phase: Architecture and Design

Strategy = Attack Surface Reduction

Avoid using wildcards in the cross-domain policy file. Any domain matching the wildcard expression will be implicitly trusted, and can perform two-way interaction with the target server.

Phase: Architecture and Design**Phase: Operation**

Strategy = Environment Hardening

For Flash, modify crossdomain.xml to use meta-policy options such as 'master-only' or 'none' to reduce the possibility of an attacker planting extraneous cross-domain policy files on a server.

Phase: Architecture and Design**Phase: Operation**

Strategy = Attack Surface Reduction

For Flash, modify crossdomain.xml to use meta-policy options such as 'master-only' or 'none' to reduce the possibility of an attacker planting extraneous cross-domain policy files on a server.

Demonstrative Examples**Example 1:**

These cross-domain policy files mean to allow Flash and Silverlight applications hosted on other domains to access its data:

Flash crossdomain.xml :

Example Language: XML

(bad)

```
<cross-domain-policy xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="http://www.adobe.com/xml/schemas/PolicyFile.xsd">
<allow-access-from domain="*.example.com"/>
<allow-access-from domain="*" />
</cross-domain-policy>
```

Silverlight clientaccesspolicy.xml :

Example Language: XML

(bad)

```
<?xml version="1.0" encoding="utf-8"?>
<access-policy>
<cross-domain-access>
<policy>
<allow-from http-request-headers="SOAPAction">
<domain uri="*" />
</allow-from>
<grant-to>
<resource path="/" include-subpaths="true"/>
</grant-to>
</policy>
</cross-domain-access>
</access-policy>
```

These entries are far too permissive, allowing any Flash or Silverlight application to send requests. A malicious application hosted on any other web site will be able to send requests on behalf of any user tricked into executing it.

Observed Examples

Reference	Description
CVE-2012-2292	Product has a Silverlight cross-domain policy that does not restrict access to another application, which allows remote attackers to bypass the Same Origin Policy. https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-2292
CVE-2014-2049	The default Flash Cross Domain policies in a product allows remote attackers to access user files. https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-2049

Reference	Description
CVE-2007-6243	Chain: Adobe Flash Player does not sufficiently restrict the interpretation and usage of cross-domain policy files, which makes it easier for remote attackers to conduct cross-domain and cross-site scripting (XSS) attacks. https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-6243
CVE-2008-4822	Chain: Adobe Flash Player and earlier does not properly interpret policy files, which allows remote attackers to bypass a non-root domain policy. https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4822
CVE-2010-3636	Chain: Adobe Flash Player does not properly handle unspecified encodings during the parsing of a cross-domain policy file, which allows remote web servers to bypass intended access restrictions via unknown vectors. https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-3636

CWE-943: Improper Neutralization of Special Elements in Data Query Logic

Weakness ID : 943

Status: Incomplete

Structure : Simple

Abstraction : Class

Description

The application generates a query intended to access or manipulate data in a data store such as a database, but it does not neutralize or incorrectly neutralizes special elements that can modify the intended logic of the query.

Extended Description

Depending on the capabilities of the query language, an attacker could inject additional logic into the query to:

- Modify the intended selection criteria, thus changing which data entities (e.g., records) are returned, modified, or otherwise manipulated
- Append additional commands to the query
- Return more entities than intended
- Return fewer entities than intended
- Cause entities to be sorted in an unexpected way

The ability to execute additional commands or change which entities are returned has obvious risks. But when the application logic depends on the order or number of entities, this can also lead to vulnerabilities. For example, if the application query expects to return only one entity that specifies an administrative user, but an attacker can change which entities are returned, this could

cause the logic to return information for a regular user and incorrectly assume that the user has administrative privileges.

While this weakness is most commonly associated with SQL injection, there are many other query languages that are also subject to injection attacks, including HTSQL, LDAP, DQL, XQuery, XPath, and "NoSQL" languages.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Integrity	Read Application Data	
Availability	Modify Application Data	
Access Control	Varies by Context	

Observed Examples

Reference	Description
CVE-2014-2503	Injection using Documentum Query Language (DQL) https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-2503
CVE-2014-2508	Injection using Documentum Query Language (DQL) https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-2508

MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name	V	Page
MemberOf		1027	OWASP Top Ten 2017 Category A1 - Injection	1026	1875

Notes

Relationship

It could be argued that data query languages are effectively a command language - albeit with a limited set of commands - and thus any query-language injection issue could be treated as a child of CWE-74. However, CWE-943 is intended to better organize query-oriented issues to separate them from fully-functioning programming languages, and also to provide a more precise identifier for the many query languages that do not have their own CWE identifier.

Maintenance

This entry will be made more comprehensive in future CWE versions.

CWE-1004: Sensitive Cookie Without 'HttpOnly' Flag

Weakness ID : 1004	Status : Incomplete
Structure : Simple	
Abstraction : Variant	

Description

The software uses a cookie to store sensitive information, but the cookie is not marked with the HttpOnly flag.

Extended Description

The HttpOnly flag directs compatible browsers to prevent client-side script from accessing cookies. Including the HttpOnly flag in the Set-Cookie HTTP response header helps mitigate the risk associated with Cross-Site Scripting (XSS) where an attacker's script code might attempt to read the contents of a cookie and exfiltrate information obtained. When set, browsers that support the flag will not reveal the contents of the cookie to a third party via client-side script executed via XSS.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf		732	Incorrect Permission Assignment for Critical Resource	1380

Relevant to the view "Development Concepts" (CWE-699)

Nature	Type	ID	Name	Page
MemberOf		442	Web Problems	1767

Applicable Platforms

Language : Language-Independent (*Prevalence = Undetermined*)

Paradigm : Web Based (*Prevalence = Undetermined*)

Technology : Web Server (*Prevalence = Undetermined*)

Background Details

An HTTP cookie is a small piece of data attributed to a specific website and stored on the user's computer by the user's web browser. This data can be leveraged for a variety of purposes including saving information entered into form fields, recording user activity, and for authentication purposes. Cookies used to save or record information generated by the user are accessed and modified by script code embedded in a web page. While cookies used for authentication are created by the website's server and sent to the user to be attached to future requests. These authentication cookies are often not meant to be accessed by the web page sent to the user, and are instead just supposed to be attached to future requests to verify authentication details.

Likelihood Of Exploit

Medium

Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data <i>If the HttpOnly flag is not set, then sensitive information stored in the cookie may be exposed to unintended parties.</i>	
Integrity	Gain Privileges or Assume Identity <i>If the cookie in question is an authentication cookie, then not setting the HttpOnly flag may allow an adversary to steal authentication data (e.g., a session ID) and assume the identity of the user.</i>	

Potential Mitigations

Phase: Implementation

Leverage the HttpOnly flag when setting a sensitive cookie in a response.

Effectiveness = High

While this mitigation is effective for protecting cookies from a browser's own scripting engine, third-party components or plugins may have their own engines that allow access to cookies. Attackers might also be able to use XMLHttpRequest to read the headers directly and obtain the cookie.

Demonstrative Examples

Example 1:

In this example, a cookie is used to store a session ID for a client's interaction with a website. The intention is that the cookie will be sent to the website with each request made by the client.

The snippet of code below establishes a new cookie to hold the sessionID.

Example Language: Java

(bad)

```
String sessionID = generateSessionId();
Cookie c = new Cookie("session_id", sessionID);
response.addCookie(c);
```

The HttpOnly flag is not set for the cookie. An attacker who can perform XSS could insert malicious script such as:

Example Language: JavaScript

(attack)

```
document.write('')
```

When the client loads and executes this script, it makes a request to the attacker-controlled web site. The attacker can then log the request and steal the cookie.

To mitigate the risk, use the `setHttpOnly(true)` method.

Example Language: Java

(good)

```
String sessionID = generateSessionId();
Cookie c = new Cookie("session_id", sessionID);
c.setHttpOnly(true);
response.addCookie(c);
```

Observed Examples

Reference	Description
CVE-2014-3852	CMS written in Python does not include the HTTPOnly flag in a Set-Cookie header, allowing remote attackers to obtain potentially sensitive information via script access to this cookie. http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-3852
CVE-2015-4138	Appliance for managing encrypted communications does not use HttpOnly flag. https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2015-4138

CWE-1007: Insufficient Visual Distinction of Homoglyphs Presented to User

Weakness ID : 1007

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The software displays information or identifiers to a user, but the display mechanism does not make it easy for the user to distinguish between visually similar or identical glyphs (homoglyphs), which may cause the user to misinterpret a glyph and perform an unintended, insecure action.

Extended Description

Some glyphs, pictures, or icons can be semantically distinct to a program, while appearing very similar or identical to a human user. These are referred to as homoglyphs. For example, the lowercase "l" (ell) and uppercase "I" (eye) have different character codes, but these characters can be displayed in exactly the same way to a user, depending on the font. This can also occur between different character sets. For example, the Latin capital letter "A" and the Greek capital letter "Α" (Alpha) are treated as distinct by programs, but may be displayed in exactly the same way to a user. Accent marks may also cause letters to appear very similar, such as the Latin capital letter grave mark "À" and its equivalent "Â" with the acute accent.

Adversaries can exploit this visual similarity for attacks such as phishing, e.g. by providing a link to an attacker-controlled hostname that looks like a hostname that the victim trusts. In a different use of homoglyphs, an adversary may create a back door username that is visually similar to the username of a regular user, which then makes it more difficult for a system administrator to detect the malicious username while reviewing logs.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Development Concepts" (CWE-699)

Nature	Type	ID	Name	Page
MemberOf		442	Web Problems	1767
ChildOf		451	User Interface (UI) Misrepresentation of Critical Information	970

Weakness Ordinalities

Resultant :

Applicable Platforms

Language : Language-Independent (*Prevalence = Undetermined*)

Paradigm : Web Based (*Prevalence = Sometimes*)

Technology : Web Server (*Prevalence = Sometimes*)

Alternate Terms

Homograph Attack : "Homograph" is often used as a synonym of "homoglyph" by researchers, but according to Wikipedia, a homograph is a word that has multiple, distinct meanings.

Likelihood Of Exploit

Medium

Common Consequences

Scope	Impact	Likelihood
Integrity Confidentiality	Other <i>An attacker may ultimately redirect a user to a malicious website, by deceiving the user into believing the URL they are accessing is a trusted domain. However, the attack can also be used to forge log entries by using homoglyphs in usernames. Homoglyph manipulations are often the first step towards executing advanced attacks such as stealing a user's credentials, Cross-Site Scripting (XSS), or log forgery. If an attacker redirects a user to a malicious site, the attacker can mimic a trusted domain to steal account credentials and perform actions on behalf of the user, without the user's knowledge. Similarly, an attacker could create a username for a website that contains homoglyph characters, making it difficult for an admin to review logs and determine which users performed which actions.</i>	

Detection Methods

Manual Dynamic Analysis

If utilizing user accounts, attempt to submit a username that contains homoglyphs. Similarly, check to see if links containing homoglyphs can be sent via email, web browsers, or other mechanisms.

Effectiveness = Moderate

Potential Mitigations

Phase: Implementation

Use a browser that displays Punycode for IDNs in the URL and status bars, or which color code various scripts in URLs. Due to the prominence of homoglyph attacks, several browsers now help safeguard against this attack via the use of Punycode. For example, Mozilla Firefox and Google Chrome will display IDNs as Punycode if top-level domains do not restrict which characters can be used in domain names or if labels mix scripts for different languages.

Phase: Implementation

Use an email client that has strict filters and prevents messages that mix character sets to end up in a user's inbox. Certain email clients such as Google's GMail prevent the use of non-Latin characters in email addresses or in links contained within emails. This helps prevent homoglyph attacks by flagging these emails and redirecting them to a user's spam folder.

Demonstrative Examples

Example 1:

The following looks like a simple, trusted URL that a user may frequently access.

Example Language:

(attack)

```
http://www.#x#m###.##m
```

However, the URL above is comprised of Cyrillic characters that look identical to the expected ASCII characters. This results in most users not being able to distinguish between the two and assuming that the above URL is trusted and safe. The "e" is actually the "CYRILLIC SMALL LETTER IE" which is represented in HTML as the character `е`, while the "a" is actually the "CYRILLIC SMALL LETTER A" which is represented in HTML as the character `а`. The "p", "c", and "o" are also Cyrillic characters in this example. Viewing the source reveals a URL of "http://www.еxаmрlе.соm". An adversary can utilize this approach to perform an attack such as a phishing attack in order to drive traffic to a malicious website.

Example 2:

The following displays an example of how creating usernames containing homoglyphs can lead to log forgery.

Assume an adversary visits a legitimate, trusted domain and creates the account "admin" where the 'a' and 'i' characters are Cyrillic characters instead of the expected ASCII. Any actions the adversary performs will be saved to the log file and look like they came from a legitimate administrator account.

Example Language:

(result)

```
123.123.123.123 #dm#n [17/Jul/2017:09:05:49 -0400] "GET /example/users/userlist HTTP/1.1" 401 12846
123.123.123.123 #dm#n [17/Jul/2017:09:06:51 -0400] "GET /example/users/userlist HTTP/1.1" 200 4523
123.123.123.123 #dm#n [17/Jul/2017:09:10:02 -0400] "GET /example/users/editusers HTTP/1.1" 200 6291
123.123.123.123 #dm#n [17/Jul/2017:09:10:02 -0400] "GET /example/users/editusers HTTP/1.1" 200 6291
123.123.123.123 #dm#n [17/Jul/2017:09:10:02 -0400] "GET /example/users/editusers HTTP/1.1" 200 6291
123.123.123.123 #dm#n [17/Jul/2017:09:10:02 -0400] "GET /example/users/editusers HTTP/1.1" 200 6291
```

However, upon closer inspection, the account that generated these log entries is "аdmіn". This makes it more difficult to determine which actions were performed by the adversary and which actions were executed by the legitimate "admin" account.

Observed Examples

CWE-1021: Improper Restriction of Rendered UI Layers or Frames

Weakness ID : 1021

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The web application does not restrict or incorrectly restricts frame objects or UI layers that belong to another application or domain, which can lead to user confusion about which interface the user is interacting with.

Extended Description

A web application is expected to place restrictions on whether it is allowed to be rendered within frames, iframes, objects, embed or applet elements. Without the restrictions, users can be tricked into interacting with the application when they were not intending to.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Nature	Type	ID	Name	Page
MemberOf		442	Web Problems	1767
ChildOf		451	User Interface (UI) Misrepresentation of Critical Information	970

Alternate Terms

Clickjacking :

UI Redress Attack :

Tapjacking : "Tapjacking" is similar to clickjacking, except it is used for mobile applications in which the user "taps" the application instead of performing a mouse click.

Common Consequences

Scope	Impact	Likelihood
Access Control	Gain Privileges or Assume Identity Bypass Protection Mechanism Read Application Data Modify Application Data <i>An attacker can trick a user into performing actions that are masked and hidden from the user's view. The impact varies widely, depending on the functionality of the underlying application. For example, in a social media application, clickjacking could be used to trick the user into changing privacy settings.</i>	

Potential Mitigations

Phase: Implementation

The use of X-Frame-Options allows developers of web content to restrict the usage of their application within the form of overlays, frames, or iFrames. The developer can indicate from which domains can frame the content. The concept of X-Frame-Options is well documented, but implementation of this protection mechanism is in development to cover gaps. There is a need for whitelisting and allowing frames from multiple domains.

Phase: Implementation

A developer can use a "frame-breaker" script in each page that should not be framed. This is very helpful for legacy browsers that do not support X-Frame-Options security feature previously mentioned. It is also important to note that this tactic has been circumvented or bypassed. Improper usage of frames can persist in the web application through nested frames. The "frame-breaking" script does not intuitively account for multiple nested frames that can be presented to the user.

Phase: Implementation

This defense-in-depth technique can be used to prevent the improper usage of frames in web applications. It prioritizes the valid sources of data to be loaded into the application through the usage of declarative policies. Based on which implementation of Content Security Policy is in

use, the developer should use the "frame-ancestors" directive or the "frame-src" directive to mitigate this weakness. Both directives allow for the placement of restrictions when it comes to allowing embedded content.

Observed Examples

Reference	Description
CVE-2017-7440	E-mail preview feature in a desktop application allows clickjacking attacks via a crafted e-mail message <i>https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-7440</i>

CWE-1022: Use of Web Link to Untrusted Target with window.opener Access

Weakness ID : 1022

Status: Incomplete

Structure : Simple

Abstraction : Variant

Description

The web application produces links to untrusted external sites outside of its sphere of control, but it does not properly prevent the external site from modifying security-critical properties of the window.opener object, such as the location property.

Extended Description

When a user clicks a link to an external site ("target"), the target="_blank" attribute causes the target site's contents to be opened in a new window or tab, which runs in the same process as the original page. The window.opener object records information about the original page that offered

the link. If an attacker can run script on the target page, then they could read or modify certain properties of the window.opener object, including the location property - even if the original and target site are not the same origin. An attacker can modify the location property to automatically redirect the user to a malicious site, e.g. as part of a phishing attack. Since this redirect happens in the original window/tab - which is not necessarily visible, since the browser is focusing the display on the new target page - the user might not notice any suspicious redirection.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

ChildOf		266	Incorrect Privilege Assignment	587

Applicable Platforms

Language : JavaScript (*Prevalence = Often*)

Paradigm : Web Based (*Prevalence = Often*)

Alternate Terms

tabnabbing :

Likelihood Of Exploit

Medium

Common Consequences

Scope	Impact	Likelihood
Confidentiality	Alter Execution Logic <i>The user may be redirected to an untrusted page that contains undesired content or malicious script code.</i>	

Potential Mitigations

Phase: Architecture and Design

Specify in the design that any linked external document must not be granted access to the location object of the calling page.

Phase: Implementation

When creating a link to an external document using the <a> tag with a defined target, for example "_blank" or a named frame, provide the rel attribute with a value "noopener noreferrer". If opening the external document in a new window via javascript, then reset the opener by setting it equal to null.

Phase: Implementation

Do not use "_blank" targets. However, this can affect the usability of your application.

Demonstrative Examples

Example 1:

In this example, the application opens a link in a named window/tab without taking precautions to prevent the called page from tampering with the calling page's location in the browser.

There are two ways that this weakness is commonly seen. The first is when the application generates an `<a>` tag is with `target="_blank"` to point to a target site:

Example Language: HTML

(bad)

```
<a href="http://attacker-site.example.com/useful-page.html" target="_blank">
```

If the attacker offers a useful page on this link (or compromises a trusted, popular site), then a user may click on this link. However, the attacker could use scripting code to modify the `window.opener`'s location property to redirect the application to a malicious, attacker-controlled page - such as one that mimics the look and feel of the original application and convinces the user to re-enter authentication credentials, i.e. phishing:

Example Language: JavaScript

(attack)

```
window.opener.location = 'http://phishing.example.org/popular-bank-page';
```

To mitigate this type of weakness, some browsers support the `"rel"` attribute with a value of `"noopener"`, which sets the `window.opener` object equal to null. Another option is to use the `"rel"` attribute with a value of `"noreferrer"`, which in essence does the same thing.

Example Language: HTML

(good)

```
<a href="http://attacker-site.example.com/useful-page.html" target="_blank" rel="noopener noreferrer">
```

A second way that this weakness is commonly seen is when opening a new site directly within JavaScript. In this case, a new site is opened using the `window.open()` function.

Example Language: JavaScript

(bad)

```
var newWindow = window.open("http://attacker-site.example.com/useful-page.html", "_blank");
```

To mitigate this, set the `window.opener` object to null.

Example Language: JavaScript

(good)

```
var newWindow = window.open("http://attacker-site.example.com/useful-page.html", "_blank");
newWindow.opener = null;
```

CWE-1023: Incomplete Comparison with Missing Factors

Weakness ID : 1023

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The software performs a comparison between entities that must consider multiple factors or characteristics of each entity, but the comparison does not include one or more of these factors. This can lead to resultant weaknesses, e.g. by operating on the wrong object.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page

Nature	Type	ID	Name	Page
ChildOf		697	Incorrect Comparison	1362

Weakness Ordinalities

Primary :

Applicable Platforms

Language : Language-Independent (*Prevalence = Undetermined*)

Common Consequences

Scope	Impact	Likelihood
Integrity	Alter Execution Logic	
Access Control	Bypass Protection Mechanism	

Potential Mitigations

Phase: Testing

Thoroughly test the comparison scheme before deploying code into production. Perform positive testing as well as negative testing.

Demonstrative Examples

Example 1:

This example defines a fixed username and password. The AuthenticateUser() function is intended to accept a username and a password from an untrusted user, and check to ensure that it matches the username and password. If the username and password match, AuthenticateUser() is intended to indicate that authentication succeeded.

Example Language: C

(bad)

```
/* Ignore CWE-259 (hard-coded password) and CWE-309 (use of password system for authentication) for this example. */
char *username = "admin";
char *pass = "password";
int AuthenticateUser(char *inUser, char *inPass) {
    if (strncmp(username, inUser, strlen(inUser))) {
        logEvent("Auth failure of username using strlen of inUser");
        return(AUTH_FAIL);
    }
}
```

```

if (! strcmp(pass, inPass, strlen(inPass))) {
    logEvent("Auth success of password using strlen of inUser");
    return(AUTH_SUCCESS);
}
else {
    logEvent("Auth fail of password using sizeof");
    return(AUTH_FAIL);
}
}
int main (int argc, char **argv) {
    int authResult;
    if (argc < 3) {
        ExitError("Usage: Provide a username and password");
    }
    authResult = AuthenticateUser(argv[1], argv[2]);
    if (authResult == AUTH_SUCCESS) {
        DoAuthenticatedTask(argv[1]);
    }
    else {
        ExitError("Authentication failed");
    }
}
}

```

In `AuthenticateUser()`, the `strcmp()` call uses the string length of an attacker-provided `inPass` parameter in order to determine how many characters to check in the password. So, if the attacker only provides a password of length 1, the check will only examine the first byte of the application's password before determining success.

As a result, this partial comparison leads to improper authentication (CWE-287).

Any of these passwords would still cause authentication to succeed for the "admin" user:

Example Language:

(attack)

```

p
pa
pas
pass

```

This significantly reduces the search space for an attacker, making brute force attacks more feasible.

The same problem also applies to the username, so values such as "a" and "adm" will succeed for the username.

While this demonstrative example may not seem realistic, see the Observed Examples for CVE entries that effectively reflect this same weakness.

CWE-1024: Comparison of Incompatible Types

Weakness ID : 1024

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The software performs a comparison between two entities, but the entities are of different, incompatible types that cannot be guaranteed to provide correct results when they are directly compared.

Extended Description

In languages that are strictly typed but support casting/conversion, such as C or C++, the programmer might assume that casting one entity to the same type as another entity will ensure

that the comparison will be performed correctly, but this cannot be guaranteed. In languages that are not strictly typed, such as PHP or JavaScript, there may be implicit casting/conversion to a type that the programmer is unaware of, causing unexpected results; for example, the string "123" might be converted to a number type. See examples.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf		697	Incorrect Comparison	1362

Relevant to the view "Development Concepts" (CWE-699)

Nature	Type	ID	Name	Page
ChildOf		697	Incorrect Comparison	1362

Weakness Ordinalities

Primary :

Applicable Platforms

Language : JavaScript (*Prevalence = Undetermined*)

Language : PHP (*Prevalence = Undetermined*)

Language : Language-Independent (*Prevalence = Undetermined*)

Common Consequences

Scope	Impact	Likelihood
Other	Varies by Context	

Potential Mitigations

Phase: Testing

Thoroughly test the comparison scheme before deploying code into production. Perform positive testing as well as negative testing.

CWE-1025: Comparison Using Wrong Factors

Weakness ID : 1025	Status: Incomplete
Structure : Simple	
Abstraction : Base	

Description

The software performs a comparison between two entities, but the comparison examines the wrong factors or characteristics of the entities, which can lead to incorrect results and resultant weaknesses.

Extended Description

A common example of this weakness occurs when the code inadvertently extracts the reference to an object, instead of its relevant contents.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to

similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf		697	Incorrect Comparison	1362
ParentOf		486	Comparison of Classes by Name	1043
ParentOf		595	Comparison of Object References Instead of Object Contents	1197

Relevant to the view "Development Concepts" (CWE-699)

Nature	Type	ID	Name	Page
ChildOf		697	Incorrect Comparison	1362

Weakness Ordinalities

Primary :

Applicable Platforms

Language : Language-Independent (*Prevalence = Undetermined*)

Common Consequences

Scope	Impact	Likelihood
Other	Varies by Context	

Potential Mitigations

Phase: Testing

Thoroughly test the comparison scheme before deploying code into production. Perform positive testing as well as negative testing.

Demonstrative Examples

Example 1:

In the example below, two Java String objects are declared and initialized with the same string values and an if statement is used to determine if the strings are equivalent.

Example Language: Java

(bad)

```
String str1 = new String("Hello");
String str2 = new String("Hello");
if (str1 == str2) {
    System.out.println("str1 == str2");
}
```

However, the if statement will not be executed as the strings are compared using the "==" operator. For Java objects, such as String objects, the "==" operator compares object references, not object values. While the two String objects above contain the same string values, they refer to different object references, so the System.out.println statement will not be executed. To compare object values, the previous code could be modified to use the equals method:

Example Language:

(good)

```
if (str1.equals(str2)) {
    System.out.println("str1 equals str2");
}
```

CWE-1037: Processor Optimization Removal or Modification of Security-critical Code

Weakness ID : 1037

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The developer builds a security-critical protection mechanism into the software, but the processor optimizes the execution of the program such that the mechanism is removed or modified.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf		1038	Insecure Automated Optimizations	1658

Relevant to the view "Development Concepts" (CWE-699)

Nature	Type	ID	Name	Page
ChildOf		1038	Insecure Automated Optimizations	1658

Weakness Ordinalities

Primary : This weakness does not depend on other weaknesses and is the result of choices made by the processor in executing the specified application.

Applicable Platforms

Language : Language-Independent (*Prevalence = Rarely*)

Likelihood Of Exploit

Low

Common Consequences

Scope	Impact	Likelihood
Integrity	Bypass Protection Mechanism	High
<p><i>A successful exploitation of this weakness will change the order of an application's execution and will likely be used to bypass specific protection mechanisms. This bypass can be exploited further to potentially read data that should otherwise be inaccessible.</i></p>		

Detection Methods

White Box

In theory this weakness can be detected through the use of white box testing techniques where specifically crafted test cases are used in conjunction with debuggers to verify the order of statements being executed.

Effectiveness = Opportunistic

Although the mentioned detection method is theoretically possible, the use of speculative execution is a preferred way of increasing processor performance. The reality is that a large number of statements are executed out of order, and determining if any of them break an access control property would be extremely opportunistic.

Observed Examples

Reference	Description
CVE-2017-5715	Intel, ARM, and AMD processor optimizations related to speculative execution and branch prediction cause access control checks to be bypassed when placing data into the cache. Often known as "Spectre". https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-5715
CVE-2017-5753	Intel, ARM, and AMD processor optimizations related to speculative execution and branch prediction cause access control checks to be bypassed when placing data into the cache. Often known as "Spectre". https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-5753
CVE-2017-5754	Intel processor optimizations related to speculative execution cause access control checks to be bypassed when placing data into the cache. Often known as "Meltdown". https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-5754

CWE-1038: Insecure Automated Optimizations

Weakness ID : 1038

Status: Draft

Structure : Simple

Abstraction : Class

Description

The product uses a mechanism that automatically optimizes code, e.g. to improve a characteristic such as performance, but the optimizations can have an unintended side effect that might violate an intended security assumption.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf		758	Reliance on Undefined, Unspecified, or Implementation-Defined Behavior	1406
ChildOf		435	Improper Interaction Between Multiple Correctly-Behaving Entities	951
ParentOf		733	Compiler Optimization Removal or Modification of Security-critical Code	1388
ParentOf		1037	Processor Optimization Removal or Modification of Security-critical Code	1657

Relevant to the view "Development Concepts" (CWE-699)

Nature	Type	ID	Name	Page
ParentOf	B	733	Compiler Optimization Removal or Modification of Security-critical Code	1388
ParentOf	B	1037	Processor Optimization Removal or Modification of Security-critical Code	1657

Weakness Ordinalities

Primary : This weakness does not depend on other weaknesses and is the result of choices made during optimization.

Applicable Platforms

Language : Language-Independent (*Prevalence = Undetermined*)

Likelihood Of Exploit

Low

Common Consequences

Scope	Impact	Likelihood
Integrity	Alter Execution Logic <i>The optimizations alter the order of execution resulting in side effects that were not intended by the original developer.</i>	

CWE-1039: Automated Recognition Mechanism with Inadequate Detection or Handling of Adversarial Input Perturbations

Weakness ID : 1039

Status: Incomplete

Structure : Simple

Abstraction : Class

Description

The product uses an automated mechanism such as machine learning to recognize complex data inputs (e.g. image or audio) as a particular concept or category, but it does not properly detect or handle inputs that have been modified or constructed in a way that causes the mechanism to detect a different, incorrect concept.

Extended Description

When techniques such as machine learning are used to automatically classify input streams, and those classifications are used for security-critical decisions, then any mistake in classification can introduce a vulnerability that allows attackers to cause the product to make the wrong security decision. If the automated mechanism is not developed or "trained" with enough input data, then attackers may be able to craft malicious input that intentionally triggers the incorrect classification.

Targeted technologies include, but are not necessarily limited to:

- automated speech recognition
- automated image recognition

For example, an attacker might modify road signs or road surface markings to trick autonomous vehicles into misreading the sign/markings and performing a dangerous action.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to

similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf		697	Incorrect Comparison	1362
ChildOf		693	Protection Mechanism Failure	1357

Relevant to the view "Development Concepts" (CWE-699)

Nature	Type	ID	Name	Page
MemberOf		19	Data Processing Errors	1749

Weakness Ordinalities

Primary : This weakness does not depend on other weaknesses and is the result of choices made during optimization.

Applicable Platforms

Language : Language-Independent (*Prevalence = Undetermined*)

Common Consequences

Scope	Impact	Likelihood
Integrity	Bypass Protection Mechanism <i>When the automated recognition is used in a protection mechanism, an attacker may be able to craft inputs that are misinterpreted in a way that grants excess privileges.</i>	

Notes

Relationship

Further investigation is needed to determine if better relationships exist or if additional organizational entries need to be created. For example, this issue might be better related to "recognition of input as an incorrect type," which might place it as a sibling of CWE-704 (incorrect type conversion).

CWE-1041: Use of Redundant Code

Weakness ID : 1041

Status: Incomplete

Structure : Simple
Abstraction : Base

Description

The software has multiple functions, methods, procedures, macros, etc. that contain the same code.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. For example, if there are two copies of the same code, the programmer might fix a weakness in one copy while forgetting to fix the same weakness in another copy.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1042: Static Member Data Element outside of a Singleton Class Element

Weakness ID : 1042
Structure : Simple

Status: Incomplete

Abstraction : Variant

Description

The code contains a member element that is declared as static (but not final), in which its parent class element is not a singleton class - that is, a class element that can be used only once in the 'to' association of a Create action.

Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1043: Data Element Aggregating an Excessively Large Number of Non-Primitive Elements

Weakness ID : 1043

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The software uses a data element that has an excessively large number of sub-elements with non-primitive data types such as structures or aggregated objects.

Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "excessively large" may vary for each product or developer, CISQ recommends a default of 5 sub-elements.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1044: Architecture with Number of Horizontal Layers Outside of Expected Range

Weakness ID : 1044

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The software's architecture contains too many - or too few - horizontal layers.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "expected range" may vary for each product or developer, CISQ recommends a default minimum of 4 layers and maximum of 8 layers.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1045: Parent Class with a Virtual Destructor and a Child Class without a Virtual Destructor

Weakness ID : 1045	Status : Incomplete
Structure : Simple	
Abstraction : Variant	

Description

A parent class has a virtual destructor method, but the parent has a child class that does not have a virtual destructor.

Extended Description

This issue can prevent the software from running reliably, since the child might not perform essential destruction operations. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability, such as a memory leak (CWE-401).

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1046: Creation of Immutable Text Using String Concatenation

Weakness ID : 1046

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The software creates an immutable text string using string concatenation operations.

Extended Description

This programming pattern can be inefficient in comparison with use of text buffer data elements.

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1047: Modules with Circular Dependencies

Weakness ID : 1047	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The software contains modules in which one module has references that cycle back to itself, i.e., there are circular dependencies.

Extended Description

As an example, with Java, this weakness might indicate cycles between packages.

This issue makes it more difficult to maintain the software due to insufficient modularity, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1048: Invokable Control Element with Large Number of Outward Calls

Weakness ID : 1048

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The code contains callable control elements that contain an excessively large number of references to other application objects external to the context of the callable, i.e. a Fan-Out value that is excessively large.

Extended Description

While the interpretation of "excessively large Fan-Out value" may vary for each product or developer, CISQ recommends a default of 5 referenced objects.

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. CWE-1049: Excessive Data Query Operations in a Large Data Table

Weakness ID : 1049	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The software performs a data query with a large number of joins and sub-queries on a large data table.

Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "large data table" and "large number of joins or sub-queries" may vary for each product or developer, CISQ recommends a default of 1 million rows for a "large" data table, a default minimum of 5 joins, and a default minimum of 3 sub-queries.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf		1176	Inefficient CPU Computation	1743

CWE-1050: Excessive Platform Resource Consumption within a Loop

Weakness ID : 1050	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The software has a loop body or loop condition that contains a control element that directly or indirectly consumes platform resources, e.g. messaging, sessions, locks, or file descriptors.

Extended Description

This issue can make the software perform more slowly. If an attacker can influence the number of iterations in the loop, then this performance problem might allow a denial of service by consuming more platform resources than intended.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1051: Initialization with Hard-Coded Network Resource Configuration Data

Weakness ID : 1051	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The software initializes data using hard-coded values that act as as network resource identifiers.

Extended Description

This issue can prevent the software from running reliably, e.g. if it runs in an environment does not use the hard-coded network resource identifiers. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1052: Excessive Use of Hard-Coded Literals in Initialization

Weakness ID : 1052	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The software initializes a data element using a hard-coded literal that is not a simple integer or static constant element.

Extended Description

This issue makes it more difficult to modify or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1053: Missing Documentation for Design

Weakness ID : 1053	Status: Incomplete
Structure : Simple	
Abstraction : Base	

Description

The product does not have documentation that represents how it is designed.

Extended Description

This issue can make it more difficult to understand and maintain the code. It can make it more difficult and time-consuming to detect and/or fix vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1054: Invocation of a Control Element at an Unnecessarily Deep Horizontal Layer

Weakness ID : 1054

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The code at one architectural layer invokes code that resides at a deeper layer than the adjacent layer, i.e., the invocation skips at least one layer, and the invoked code is not part of a vertical utility layer that can be referenced from any horizontal layer.

Extended Description

This issue makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1055: Multiple Inheritance from Concrete Classes

Weakness ID : 1055	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The software contains a class with inheritance from more than one concrete class.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1056: Invokable Control Element with Variadic Parameters

Weakness ID : 1056	Status : Incomplete
---------------------------	----------------------------

Structure : Simple
Abstraction : Base

Description

A named-callable or method control element has a signature that supports a variable (variadic) number of parameters or arguments.

Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

With variadic arguments, it can be difficult or inefficient for manual analysis to be certain of which function/method is being invoked.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1057: Data Access Operations Outside of Expected Data Manager Component

Weakness ID : 1057	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The software uses a dedicated, central data manager component as required by design, but it contains code that performs data-access operations that do not use this data manager.

Extended Description

This issue can make the software perform more slowly than intended, since the intended central data manager may have been explicitly optimized for performance or other quality characteristics. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1058: Invokable Control Element in Multi-Thread Context with non-Final Static Storable or Member Element

Weakness ID : 1058

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The code contains a function or method that operates in a multi-threaded environment but owns an unsafe non-final static storable or member data element.

Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1059: Incomplete Documentation

Weakness ID : 1059	Status : Incomplete
Structure : Simple	
Abstraction : Class	

Description

The documentation, whether on paper or in electronic form, does not contain descriptions of all the relevant elements of the product, such as its usage, structure, interfaces, design, implementation, configuration, operation, etc.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1060: Excessive Number of Inefficient Server-Side Data Accesses

Weakness ID : 1060	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The software performs too many data queries without using efficient data processing functionality such as stored procedures.

Extended Description

This issue can make the software perform more slowly due to computational expense. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "too many data queries" may vary for each product or developer, CISQ recommends a default maximum of 5 data queries for an inefficient function/procedure.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1061: Insufficient Encapsulation

Weakness ID : 1061

Status: Incomplete

Structure : Simple

Abstraction : Class

Description

The software does not sufficiently hide the internal representation and implementation details of data or methods, which might allow external components or modules to modify data unexpectedly, invoke unexpected functionality, or introduce dependencies that the programmer did not intend.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1062: Parent Class with References to Child Class

Weakness ID : 1062	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The code has a parent class that contains references to a child class, its methods, or its members.

Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1063: Creation of Class Instance within a Static Code Block

Weakness ID : 1063	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

A static code block creates an instance of a class.

Extended Description

This pattern identifies situations where a storable data element or member data element is initialized with a value in a block of code which is declared as static.

This issue can make the software perform more slowly by performing initialization before it is needed. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1064: Invokable Control Element with Signature Containing an Excessive Number of Parameters

Weakness ID : 1064

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The software contains a function, subroutine, or method whose signature has an unnecessarily large number of parameters/arguments.

Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "large number of parameters." may vary for each product or developer, CISQ recommends a default maximum of 7 parameters/arguments.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1065: Runtime Resource Management Control Element in a Component Built to Run on Application Servers

Weakness ID : 1065	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The application uses deployed components from application servers, but it also uses low-level functions/methods for management of resources, instead of the API provided by the application server.

Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

CWE-1066: Missing Serialization Control Element

Weakness ID : 1066**Status**: Incomplete**Structure** : Simple**Abstraction** : Base

Description

The software contains a serializable data element that does not have an associated serialization method.

Extended Description

This issue can prevent the software from running reliably, e.g. by triggering an exception. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

As examples, the serializable nature of a data element comes from a serializable `SerializableAttribute` attribute in .NET and the inheritance from the `java.io.Serializable` interface in Java.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as `ChildOf`, `ParentOf`, `MemberOf` and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as `PeerOf` and `CanAlsoBe` are defined to show similar weaknesses that may want to be explored.

CWE-1067: Excessive Execution of Sequential Searches of Data Resource

Weakness ID : 1067**Status**: Incomplete**Structure** : Simple**Abstraction** : Base

Description

The software contains a data query against an SQL table or view that is configured in a way that does not utilize an index and may cause sequential searches to be performed.

Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1068: Inconsistency Between Implementation and Documented Design

Weakness ID : 1068**Status**: Incomplete

Structure : Simple
Abstraction : Base

Description

The implementation of the product is not consistent with the design as described within the relevant documentation.

Extended Description

This issue makes it more difficult to maintain the software due to inconsistencies, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1069: Empty Exception Block

Weakness ID : 1069 **Status**: Incomplete
Structure : Simple
Abstraction : Variant

Description

An invocable code block contains an exception handling block that does not contain any code, i.e. is empty.

Extended Description

When an exception handling block (such as a Catch and Finally block) is used, but that block is empty, this can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to

similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1070: Serializable Data Element Containing non-Serializable Item Elements

Weakness ID : 1070	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The software contains a serializable, storable data element such as a field or member, but the data element contains member elements that are not serializable.

Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

As examples, the serializable nature of a data element comes from a serializable SerializableAttribute attribute in .NET and the inheritance from the java.io.Serializable interface in Java.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1071: Empty Code Block

Weakness ID : 1071	Status : Incomplete
Structure : Simple	
Abstraction : Variant	

Description

The source code contains a block that does not contain any code, i.e., the block is empty.

Extended Description

Empty code blocks can occur in the bodies of conditionals, function or method definitions, exception handlers, etc. While an empty code block might be intentional, it might also indicate incomplete implementation, accidental code deletion, unexpected macro expansion, etc. For some programming languages and constructs, an empty block might be allowed by the syntax, but the lack of any behavior within the block might violate a convention or API in such a way that it is an error.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1072: Data Resource Access without Use of Connection Pooling

Weakness ID : 1072	Status: Incomplete
Structure : Simple	
Abstraction : Base	

Description

The software accesses a data resource through a database without using a connection pooling capability.

Extended Description

This issue can make the software perform more slowly, as connection pools allow connections to be reused without the overhead and time consumption of opening and closing a new connection. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1073: Non-SQL Invokable Control Element with Excessive Number of Data Resource Accesses

Weakness ID : 1073	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The software contains a client with a function or method that contains a large number of data accesses/queries that are sent through a data manager, i.e., does not use efficient database capabilities.

Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "large number of data accesses/queries" may vary for each product or developer, CISQ recommends a default maximum of 2 data accesses per function/method.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1074: Class with Excessively Deep Inheritance

Weakness ID : 1074	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

A class has an inheritance level that is too high, i.e., it has a large number of parent classes.

Extended Description

This issue makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "large number of parent classes" may vary for each product or developer, CISQ recommends a default maximum of 7 parent classes.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1075: Unconditional Control Flow Transfer outside of Switch Block

Weakness ID : 1075

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The software performs unconditional control transfer (such as a "goto") in code outside of a branching structure such as a switch block.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1076: Insufficient Adherence to Expected Conventions

Weakness ID : 1076	Status : Incomplete
Structure : Simple	
Abstraction : Class	

Description

The product's architecture, source code, design, documentation, or other artifact does not follow required conventions.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Other	Reduce Maintainability	

CWE-1077: Floating Point Comparison with Incorrect Operator

Weakness ID : 1077

Status: Incomplete

Structure : Simple

Abstraction : Variant

Description

The code performs a comparison such as an equality test between two float (floating point) values, but it uses comparison operators that do not account for the possibility of loss of precision.

Extended Description

Numeric calculation using floating point values can generate imprecise results because of rounding errors. As a result, two different calculations might generate numbers that are mathematically equal, but have slightly different bit representations that do not translate to the same mathematically-equal values. As a result, an equality test or other comparison might produce unexpected results.

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1079: Parent Class without Virtual Destructor Method

Weakness ID : 1079

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

A parent class contains one or more child classes, but the parent class does not have a virtual destructor method.

Extended Description

This issue can prevent the software from running reliably due to undefined or unexpected behaviors. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1080: Source Code File with Excessive Number of Lines of Code

Weakness ID : 1080	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

A source code file has too many lines of code.

Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "too many lines of code" may vary for each product or developer, CISQ recommends a default threshold value of 1000.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1082: Class Instance Self Destruction Control Element

Weakness ID : 1082

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The code contains a class instance that calls the method or function to delete or destroy itself.

Extended Description

For example, in C++, "delete this" will cause the object to delete itself.

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1083: Data Access from Outside Expected Data Manager Component

Weakness ID : 1083	Status: Incomplete
Structure : Simple	
Abstraction : Base	

Description

The software is intended to manage data access through a particular data manager component such as a relational or non-SQL database, but it contains code that performs data access operations without using that component.

Extended Description

When the software has a data access component, the design may be intended to handle all data access operations through that component. If a data access operation is performed outside of that component, then this may indicate a violation of the intended design.

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1084: Invokable Control Element with Excessive File or Data Access Operations

Weakness ID : 1084

Status: Incomplete

Structure : Simple
Abstraction : Base

Description

A function or method contains too many operations that utilize a data manager or file resource.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "too many operations" may vary for each product or developer, CISQ recommends a default maximum of 7 operations for the same data manager or file.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1085: Invokable Control Element with Excessive Volume of Commented-out Code

Weakness ID : 1085

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

A function, method, procedure, etc. contains an excessive amount of code that has been commented out within its body.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "excessive volume" may vary for each product or developer, CISQ recommends a default threshold of 2% of commented code.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1086: Class with Excessive Number of Child Classes

Weakness ID : 1086

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

A class contains an unnecessarily large number of children.

Extended Description

This issue makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "large number of children" may vary for each product or developer, CISQ recommends a default maximum of 10 child classes.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1088: Synchronous Access of Remote Resource without Timeout**Weakness ID :** 1088**Status:** Incomplete

Structure : Simple
Abstraction : Base

Description

The code has a synchronous call to a remote resource, but there is no timeout for the call, or the timeout is set to infinite.

Extended Description

This issue can prevent the software from running reliably, since an outage for the remote resource can cause the software to hang. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1089: Large Data Table with Excessive Number of Indices

Weakness ID : 1089 **Status**: Incomplete
Structure : Simple
Abstraction : Base

Description

The software uses a large data table that contains an excessively large number of indices.

Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "large data table" and "excessively large number of indices" may vary for each product or developer, CISQ recommends a default threshold of 1000000 rows for a "large" table and a default threshold of 3 indices.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1090: Method Containing Access of a Member Element from Another Class

Weakness ID : 1090

Status: Incomplete

Structure : Simple

Abstraction : Base**Description**

A method for a class performs an operation that directly accesses a member element from another class.

Extended Description

This issue suggests poor encapsulation and makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1091: Use of Object without Invoking Destructor Method

Weakness ID : 1091

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The software contains a method that accesses an object but does not later invoke the element's associated finalize/destructor method.

Extended Description

This issue can make the software perform more slowly by retaining memory and/or other resources longer than necessary. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1093: Excessively Complex Data Representation

Weakness ID : 1093	Status : Incomplete
Structure : Simple	
Abstraction : Class	

Description

The software uses an unnecessarily complex internal representation for its data structures or interrelationships between those structures.

Extended Description

This issue makes it more difficult to understand or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1094: Excessive Index Range Scan for a Data Resource

Weakness ID : 1094

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The software contains an index range scan for a large data table, but the scan can cover a large number of rows.

Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "large data table" and "excessive index range" may vary for each product or developer, CISQ recommends a threshold of 1000000 table rows and a threshold of 10 for the index range.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1095: Loop Condition Value Update within the Loop

Weakness ID : 1095	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The software uses a loop with a control flow condition based on a value that is updated within the body of the loop.

Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1096: Singleton Class Instance Creation without Proper Locking or Synchronization

Weakness ID : 1096	Status : Incomplete
Structure : Simple	
Abstraction : Variant	

Description

The software implements a Singleton design pattern but does not use appropriate locking or other synchronization mechanism to ensure that the singleton class is only instantiated once.

Extended Description

This issue can prevent the software from running reliably, e.g. by making the instantiation process non-thread-safe and introducing deadlock (CWE-833) or livelock conditions. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1097: Persistent Storable Data Element without Associated Comparison Control Element

Weakness ID : 1097	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The software uses a storable data element that does not have all of the associated functions or methods that are necessary to support comparison.

Extended Description

For example, with Java, a class that is made persistent requires both hashCode() and equals() methods to be defined.

This issue can prevent the software from running reliably, due to incorrect or unexpected comparison results. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1098: Data Element containing Pointer Item without Proper Copy Control Element

Weakness ID : 1098

Status: Incomplete

Structure : Simple

Abstraction : Variant

Description

The code contains a data element with a pointer that does not have an associated copy or constructor method.

Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1099: Inconsistent Naming Conventions for Identifiers

Weakness ID : 1099	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The product's code, documentation, or other artifacts do not consistently use the same naming conventions for variables, callables, groups of related callables, I/O capabilities, data types, file names, or similar types of elements.

Extended Description

This issue makes it more difficult to understand and/or maintain the software due to inconsistencies, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1100: Insufficient Isolation of System-Dependent Functions

Weakness ID : 1100

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The product or code does not isolate system-dependent functionality into separate standalone modules.

Extended Description

This issue makes it more difficult to maintain and/or port the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1101: Reliance on Runtime Component in Generated Code

Weakness ID : 1101	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The product uses automatically-generated code that cannot be executed without a specific runtime support component.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1102: Reliance on Machine-Dependent Data Representation

Weakness ID : 1102	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The code uses a data representation that relies on low-level data representation or constructs that may vary across different processors, physical machines, OSes, or other physical components.

Extended Description

This issue makes it more difficult to maintain and/or port the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1103: Use of Platform-Dependent Third Party Components

Weakness ID : 1103	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The product relies on third-party software components that do not provide equivalent functionality across all desirable platforms.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1104: Use of Unmaintained Third Party Components

Weakness ID : 1104	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The product relies on third-party components that are not actively supported or maintained by the original developer or a trusted proxy for the original developer.

Extended Description

Reliance on components that are no longer maintained can make it difficult or impossible to fix significant bugs, vulnerabilities, or quality issues. In effect, unmaintained code can become obsolete.

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1105: Insufficient Encapsulation of Machine-Dependent Functionality

Weakness ID : 1105

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The product or code uses machine-dependent functionality, but it does not sufficiently encapsulate or isolate this functionality from the rest of the code.

Extended Description

This issue makes it more difficult to port or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1106: Insufficient Use of Symbolic Constants

Weakness ID : 1106	Status: Incomplete
Structure : Simple	
Abstraction : Base	

Description

The source code uses literal constants that may need to change or evolve over time, instead of using symbolic constants.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1107: Insufficient Isolation of Symbolic Constant Definitions

Weakness ID : 1107

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The source code uses symbolic constants, but it does not sufficiently place the definitions of these constants into a more centralized or isolated location.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1108: Excessive Reliance on Global Variables

Weakness ID : 1108	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The code is structured in a way that relies too much on using or setting global variables throughout various points in the code, instead of preserving the associated information in a narrower, more local context.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1109: Use of Same Variable for Multiple Purposes

Weakness ID : 1109	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The code contains a callable, block, or other code element in which the same variable is used to control more than one unique task or store more than one instance of data.

Extended Description

Use of the same variable for multiple purposes can make it more difficult for a person to read or understand the code, potentially hiding other quality issues.

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1113: Inappropriate Comment Style

Weakness ID : 1113

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The source code uses comment styles or formats that are inconsistent or do not follow expected standards for the product.

Extended Description

This issue makes it more difficult to maintain the software due to insufficient legibility, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1114: Inappropriate Whitespace Style

Weakness ID : 1114	Status: Incomplete
Structure : Simple	
Abstraction : Base	

Description

The source code contains whitespace that is inconsistent across the code or does not follow expected standards for the product.

Extended Description

This issue makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1115: Source Code Element without Standard Prologue

Weakness ID : 1115	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The source code contains elements such as source files that do not consistently provide a prologue or header that has been standardized for the project.

Extended Description

The lack of a prologue can make it more difficult to accurately and quickly understand the associated code. Standard prologues or headers may contain information such as module name, version number, author, date, purpose, function, assumptions, limitations, accuracy considerations, etc.

This issue makes it more difficult to maintain the software due to insufficient analyzability, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1116: Inaccurate Comments

Weakness ID : 1116	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The source code contains comments that do not accurately describe or explain aspects of the portion of the code with which the comment is associated.

Extended Description

When a comment does not accurately reflect the associated code elements, this can introduce confusion to a reviewer (due to inconsistencies) or make it more difficult and less efficient to validate that the code is implementing the intended behavior correctly.

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1117: Callable with Insufficient Behavioral Summary

Weakness ID : 1117	Status: Incomplete
Structure : Simple	
Abstraction : Base	

Description

The code contains a function or method whose signature and/or associated inline documentation does not sufficiently describe the callable's inputs, outputs, side effects, assumptions, or return codes.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1118: Insufficient Documentation of Error Handling Techniques

Weakness ID : 1118	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The documentation does not sufficiently describe the techniques that are used for error handling, exception processing, or similar mechanisms.

Extended Description

Documentation may need to cover error handling techniques at multiple layers, such as module, executable, compilable code unit, or callable.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1119: Excessive Use of Unconditional Branching

Weakness ID : 1119	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The code uses too many unconditional branches (such as "goto").

Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1120: Excessive Code Complexity

Weakness ID : 1120**Status**: Incomplete**Structure** : Simple**Abstraction** : Class

Description

The code is too complex, as calculated using a well-defined, quantitative measure.

Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1121: Excessive McCabe Cyclomatic Complexity

Weakness ID : 1121	Status : Incomplete
Structure : Simple	
Abstraction : Base	

Description

The code contains McCabe cyclomatic complexity that exceeds a desirable maximum.

Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. CWE-1122: Excessive Halstead Complexity

Weakness ID : 1122

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The code is structured in a way that a Halstead complexity measure exceeds a desirable maximum.

Extended Description

A variety of Halstead complexity measures exist, such as program vocabulary size or volume.

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. CWE-1123: Excessive Use of Self-Modifying Code

Weakness ID : 1123

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The product uses too much self-modifying code.

Extended Description

This issue makes it more difficult to understand or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1124: Excessively Deep Nesting

Weakness ID : 1124

Status: Incomplete

Structure : Simple
Abstraction : Base

Description

The code contains a callable or other code grouping in which the nesting / branching is too deep.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1125: Excessive Attack Surface

Weakness ID : 1125 **Status**: Incomplete
Structure : Simple
Abstraction : Base

Description

The product has an attack surface whose quantitative measurement exceeds a desirable maximum.

Extended Description

Originating from software security, an "attack surface" measure typically reflects the number of input points and output points that can be utilized by an untrusted party, i.e. a potential attacker. A larger attack surface provides more places to attack, and more opportunities for developers to introduce weaknesses. In some cases, this measure may reflect other aspects of quality besides

security; e.g., a product with many inputs and outputs may require a large number of tests in order to improve code coverage.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1126: Declaration of Variable with Unnecessarily Wide Scope

Weakness ID : 1126	Status: Incomplete
Structure : Simple	
Abstraction : Base	

Description

The source code declares a variable in one scope, but the variable is only used within a narrower scope.

Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1164: Irrelevant Code**Weakness ID :** 1164**Status:** Incomplete**Structure :** Simple**Abstraction :** Class**Description**

The program contains code that is not essential for execution, i.e. makes no state changes and has no side effects that alter data or control flow, such that removal of the code would have no impact to functionality or correctness.

Extended Description

Irrelevant code could include dead code, initialization that is not used, empty blocks, code that could be entirely removed due to optimization, etc.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1173: Improper Use of Validation Framework

Weakness ID : 1173	Status : Draft
Structure : Simple	
Abstraction : Base	

Description

The application does not use, or incorrectly uses, an input validation framework that is provided by the source language or an independent library.

Extended Description

Many modern coding languages provide developers with input validation frameworks to make the task of input validation easier and less error-prone. These frameworks will automatically check all input against specified criteria and direct execution to error handlers when invalid input is received. The improper use (i.e., an incorrect implementation or missing altogether) of these frameworks is not directly exploitable, but can lead to an exploitable condition if proper input validation is not performed later in the application. Not using provided input validation frameworks can also hurt the

maintainability of code as future developers may not recognize the downstream input validation being used in the place of the validation framework.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

ParentOf		1174	ASP.NET Misconfiguration: Improper Model Validation	1743

Weakness Ordinalities

Indirect :

Applicable Platforms

Language : Language-Independent (*Prevalence = Undetermined*)

Common Consequences

Scope	Impact	Likelihood
Integrity	Unexpected State <i>Unchecked input leads to cross-site scripting, process control, and SQL injection vulnerabilities, among others.</i>	

Detection Methods

Automated Static Analysis

Some instances of improper input validation can be detected using automated static analysis. A static analysis tool might allow the user to specify which application-specific methods or functions perform input validation; the tool might also have built-in knowledge of validation frameworks such as Struts. The tool may then suppress or de-prioritize any associated warnings. This allows

the analyst to focus on areas of the software in which input validation does not appear to be present. Except in the cases described in the previous paragraph, automated static analysis might not be able to recognize when proper input validation is being performed, leading to false positives - i.e., warnings that do not have any security consequences or require any code changes.

Potential Mitigations

Phase: Implementation

Properly use provided input validation frameworks.

CWE-1174: ASP.NET Misconfiguration: Improper Model Validation

Weakness ID : 1174

Status: Draft

Structure : Simple

Abstraction : Variant

Description

The ASP.NET application does not use, or incorrectly uses, the model validation framework.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Common Consequences

Scope	Impact	Likelihood
Integrity	Unexpected State <i>Unchecked input leads to cross-site scripting, process control, and SQL injection vulnerabilities, among others.</i>	

CWE-1176: Inefficient CPU Computation

Weakness ID : 1176

Status: Incomplete

Structure : Simple

Abstraction : Class

Description

The program performs CPU computations using algorithms that are not as efficient as they could be for the needs of the developer, i.e., the computations can be optimized further.

Extended Description

This issue can make the software perform more slowly, possibly in ways that are noticeable to the users. If an attacker can influence the amount of computation that must be performed, e.g. by triggering worst-case complexity, then this performance problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf		405	Asymmetric Resource Consumption (Amplification)	890
ParentOf		1042	Static Member Data Element outside of a Singleton Class Element	1661
ParentOf		1046	Creation of Immutable Text Using String Concatenation	1666
ParentOf		1049	Excessive Data Query Operations in a Large Data Table	1669
ParentOf		1063	Creation of Class Instance within a Static Code Block	1683
ParentOf		1067	Excessive Execution of Sequential Searches of Data Resource	1687

Relevant to the view "Development Concepts" (CWE-699)

CWE-1177: Use of Prohibited Code

Weakness ID : 1177

Status: Incomplete

Structure : Simple

Abstraction : Class

Description

The software uses a function, library, or third party component that has been explicitly prohibited, whether by the developer or the customer.

Extended Description

The developer - or customers - may wish to restrict or eliminate use of a function, library, or third party component for any number of reasons, including real or suspected vulnerabilities; difficulty to use securely; export controls or license requirements; obsolete or poorly-maintained code; internal code being scheduled for deprecation; etc.

To reduce risk of vulnerabilities, the developer might maintain a list of "banned" functions that programmers must avoid using because the functions are difficult or impossible to use securely. This issue can also make the software more costly and difficult to maintain.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf		710	Improper Adherence to Coding Standards	1378
ParentOf		242	Use of Inherently Dangerous Function	544
ParentOf		676	Use of Potentially Dangerous Function	1329

CWE-1187: Use of Uninitialized Resource

Weakness ID : 1187	Status: Incomplete
Structure : Simple	
Abstraction : Base	

Description

The software uses or accesses a resource that has not been initialized.

Extended Description

When a resource has not been properly initialized, the software may behave unexpectedly. Typically this leads to a crash or invalid memory access, but the consequences vary depending on the type of resource and how it is used within the software.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

CWE-1188: Insecure Default Initialization of Resource

Weakness ID : 1188

Status: Incomplete

Structure : Simple

Abstraction : Base

Description

The software initializes or sets a resource with a default that is intended to be changed by the administrator, but the default is not secure.

Extended Description

Developers often choose default values that leave the software as open and easy to use as possible out-of-the-box, under the assumption that the administrator can (or should) change the default value. However, this ease-of-use comes at a cost when the default is insecure and the administrator does not change it.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Notes

Maintenance

This entry improves organization of concepts under initialization. The typical CWE model is to cover "Missing" and "Incorrect" behaviors. Arguably, this entry could be named as "Incorrect" instead of "Insecure." This might be changed in the near future.

Categories

Category-2: 7PK - Environment

Category ID : 2

Status: Draft

Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that are typically introduced during unexpected environmental conditions. According to the authors of the Seven Pernicious Kingdoms, "This section includes everything that is outside of the source code but is still critical to the security of the product that is being created. Because the issues covered by this kingdom are not directly related to source code, we separated it from the rest of the kingdoms."

Membership

Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
WASC	14		Server Misconfiguration
WASC	15		Application Misconfiguration

Notes

Maintenance

This entry is a Category, but various sources map to it anyway, e.g. by NVD, despite CWE guidance that Categories should not be mapped. In this case, there are no clear CWE Weaknesses that can be utilized. "Inappropriate Configuration" might be better described as a Weakness, so this entry might be converted to a Weakness in a later version. Further research is required, however, as a "configuration weakness" might be Primary to many other CWEs, i.e., it might be better described in terms of chaining relationships.

Category-19: Data Processing Errors

Category ID : 19

Status: Draft

Summary

Weaknesses in this category are typically found in functionality that processes data.

Membership

Nature	Type	ID	Name	V	Page

Category-21: Pathname Traversal and Equivalence Errors

Category ID : 21

Status: Incomplete

Summary

Weaknesses in this category can be used to access files outside of a restricted directory (path traversal) or to perform operations on files that would otherwise be restricted (path equivalence). Files, directories, and folders are so central to information technology that many different weaknesses and variants have been discovered. The manipulations generally involve special characters or sequences in pathnames, or the use of alternate references or channels.

Category-227: 7PK - API Abuse

Category ID : 227

Status: Draft

Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that involve the software using an API in a manner contrary to its intended use. According to the authors of the Seven Pernicious Kingdoms, "An API is a contract between a caller and a callee. The most common forms of API misuse occurs when the caller does not honor its end of this contract. For example, if a program does not call `chdir()` after calling `chroot()`, it violates the contract that specifies how to change the active root directory in a secure fashion. Another good example of library abuse is expecting the callee to return trustworthy DNS information to the caller. In this case, the caller misuses the callee API by making certain assumptions about its behavior (that the return value can be used for authentication purposes). One can also violate the caller-callee contract from the other side. For example, if a coder subclasses `SecureRandom` and returns a non-random value, the contract is violated."

Category-265: Privilege / Sandbox Issues

Category ID : 265

Status: Incomplete

Summary

Weaknesses in this category occur with improper enforcement of sandbox environments, or the improper handling, assignment, or management of privileges.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	264	Permissions, Privileges, and Access Controls	699	1755

Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
PLOVER			Privilege / sandbox errors

Notes

Relationship

This can strongly overlap authorization errors.

Theoretical

A sandbox could be regarded as an explicitly defined sphere of control, in that the sandbox only defines a limited set of behaviors, which can only access a limited set of resources.

Theoretical

It could be argued that any privilege problem occurs within the context of a sandbox.

Research Gap

Many of the following concepts require deeper study. Most privilege problems are not classified at such a low level of detail, and terminology is very sparse. Certain classes of software, such as web browsers and software bug trackers, provide a rich set of examples for further research. Operating systems have matured to the point that these kinds of weaknesses are rare, but finer-grained models for privileges, capabilities, or roles might introduce subtler issues.

Category-275: Permission Issues

Category ID : 275

Status: Draft

Summary

Weaknesses in this category are related to improper assignment or handling of permissions.

Membership

Category-361: 7PK - Time and State

Category ID : 361

Status: Incomplete

Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses related to the improper management of time and state in an environment that supports simultaneous or near-simultaneous computation by multiple systems, processes, or threads. According to the authors of the Seven Pernicious Kingdoms, "Distributed computation is about time and state. That is, in order for more than one component to communicate, state must be shared, and all that takes time. Most programmers anthropomorphize their work. They think about one thread of control carrying out the entire program in the same way they would if they had to do the job themselves. Modern computers, however, switch between tasks very quickly, and in multi-core, multi-CPU, or distributed systems, two events may take place at exactly the same time. Defects rush to fill the gap between the programmer's model of

how a program executes and what happens in reality. These defects are related to unexpected interactions between threads, processes, time, and information. These interactions happen through shared state: semaphores, variables, the file system, and, basically, anything that can store information."

Notes

Maintenance

Several sub-categories could exist, but this needs more study. Some sub-categories might be unhandled signals, untrusted signals, and sending the wrong signals.

Category-388: 7PK - Errors

Category ID : 388 Status: Draft

Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that occur when an application does not properly handle errors that occur during processing. According to the authors of the Seven Pernicious Kingdoms, "Errors and error handling represent a class of API. Errors related to error handling are so common that they deserve a special kingdom of their own. As with 'API Abuse,' there are two ways to introduce an error-related security vulnerability: the most common one is handling errors poorly (or not at all). The second is producing errors that either give out too much information (to possible attackers) or are difficult to handle."

Category-389: Error Conditions, Return Values, Status Codes

Category ID : 389

Status: Incomplete

Summary

This category includes weaknesses that occur if a function does not generate the correct return/status code, or if the application does not handle all possible return/status codes that could be generated by a function. This type of problem is most often found in conditions that are rarely encountered during the normal operation of the product. Presumably, most bugs related to common conditions are found and eliminated during development and testing. In some cases, the attacker can directly control or influence the environment to trigger the rare conditions.

Membership

HasMember	G	703	Improper Check or Handling of Exceptional Conditions	699	1368
HasMember	G	756	Missing Custom Error Page	699	1404

Notes

Other

Many researchers focus on the resultant weaknesses and do not necessarily diagnose whether a rare condition is the primary factor. However, since 2005 it seems to be reported more frequently than in the past. This subject needs more study.

Category-398: 7PK - Code Quality

Category ID : 398

Status: Draft

Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that do not directly introduce a weakness or vulnerability, but indicate that the product has not been carefully developed or maintained. According to the authors of the Seven Pernicious Kingdoms, "Poor code quality leads to unpredictable behavior. From a user's perspective that often manifests itself as poor usability. For an adversary it provides an opportunity to stress the system in unexpected ways."

Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
PLOVER	CHAP.VIRTFILE		Channel and Path Errors

Notes

Relationship

A number of vulnerabilities are specifically related to problems in creating, managing, or removing alternate channels and alternate paths. Some of these can overlap virtual file problems. They are commonly used in "bypass" attacks, such as those that exploit authentication errors.

Maintenance

This category is being considered for deprecation. It is not clear whether communication channels are related closely enough to access paths. In addition, the "path" term is probably assumed by many readers to be associated with file paths, as opposed to the original meaning as intended in PLOVER.

Research Gap

Most of these issues are probably under-studied. Only a handful of public reports exist.

Category-429: Handler Errors

Category-485: 7PK - Encapsulation

Category ID : 485

Status: Draft

Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that occur when the product does not sufficiently encapsulate critical data or functionality. According to the authors of the Seven Pernicious Kingdoms, "Encapsulation is about drawing strong boundaries. In a web browser that might mean ensuring

that your mobile code cannot be abused by other mobile code. On the server it might mean differentiation between validated data and unvalidated data, between one user's data and another's, or between data users are allowed to see and data that they are not."

Membership

Nature	Type	ID	Name	V	Page

HasMember	V	486	Comparison of Classes by Name	700	1043
HasMember	V	488	Exposure of Data Element to Wrong Session	700	1047
HasMember	B	489	Leftover Debug Code	700	1049
HasMember	V	491	Public cloneable() Method Without Final ('Object Hijack')	700	1051
HasMember	V	492	Use of Inner Class Containing Sensitive Data	700	1053
HasMember	V	493	Critical Public Variable Without Final Modifier	700	1060
HasMember	V	495	Private Data Structure Returned From A Public Method	700	1066
HasMember	V	496	Public Data Assigned to Private Array-Typed Field	700	1068
HasMember	V	497	Exposure of System Data to an Unauthorized Control Sphere	700	1069
HasMember	B	501	Trust Boundary Violation	700	1077

Notes

Other

The "encapsulation" term is used in multiple ways. Within some security sources, the term is used to describe the establishment of boundaries between different control spheres. Within general computing circles, it is more about hiding implementation details and maintainability than security. Even within the security usage, there is also a question of whether "encapsulation" encompasses the entire range of security problems.

Category-735: CERT C Secure Coding Standard (2008) Chapter 2 - Preprocessor (PRE)

Category ID : 735

Status: Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Preprocessor (PRE) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1917
HasMember	C	684	Incorrect Provision of Specified Functionality	734	1344

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-684 PRE09-C Do not replace secure functions with less secure functions

References

[REF-597]Robert C. Seacord. "The CERT C Secure Coding Standard". 1st Edition. 2008 October 4. Addison-Wesley Professional.

Category-736: CERT C Secure Coding Standard (2008) Chapter 3 - Declarations and Initialization (DCL)

Category ID : 736

Status: Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Declarations and Initialization (DCL) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	Page
MemberOf	☑	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734 1917
HasMember	Ⓧ	547	Use of Hard-coded, Security-relevant Constants	734 1127
HasMember	ⓑ	628	Function Call with Incorrectly Specified Arguments	734 1253
HasMember	Ⓧ	686	Function Call With Incorrect Argument Type	734 1346

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-547 DCL06-C Use meaningful symbolic constants to represent literal values in program logic CWE-628 DCL10-C Maintain the contract between the writer and caller of variadic functions CWE-686 DCL35-C Do not invoke a function using a type that does not match the function definition

Category-737: CERT C Secure Coding Standard (2008) Chapter 4 - Expressions (EXP)

Category ID : 737

Status: Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Expressions (EXP) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	Page
MemberOf	☑	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734 1917
HasMember	Ⓧ	467	Use of sizeof() on a Pointer Type	734 998

Nature	Type	ID	Name	V	Page
HasMember	B	468	Incorrect Pointer Scaling	734	1001
HasMember	B	476	NULL Pointer Dereference	734	1017
HasMember	B	628	Function Call with Incorrectly Specified Arguments	734	1253
HasMember	C	704	Incorrect Type Conversion or Cast	734	1370
HasMember	B	783	Operator Precedence Logic Error	734	1468

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-467 EXP01-C Do not take the size of a pointer to determine the size of the pointed-to type CWE-468 EXP08-C Ensure pointer arithmetic is used correctly CWE-476 EXP34-C Ensure a null pointer is not dereferenced CWE-628 EXP37-C Call functions with the arguments intended by the API CWE-704 EXP05-C Do not cast away a const qualification CWE-783 EXP00-C Use parentheses for precedence of operation

Category-738: CERT C Secure Coding Standard (2008) Chapter 5 - Integers (INT)

Category ID : 738

Status: Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Integers (INT) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1917
HasMember	C	20	Improper Input Validation	734	18
HasMember	B	129	Improper Validation of Array Index	734	318
HasMember	B	190	Integer Overflow or Wraparound	734	446
HasMember	V	192	Integer Coercion Error	734	455
HasMember	B	197	Numeric Truncation Error	734	471
HasMember	B	369	Divide By Zero	734	826
HasMember	B	466	Return of Pointer Value Outside of Expected Range	734	997
HasMember	B	587	Assignment of a Fixed Address to a Pointer	734	1185
HasMember	B	606	Unchecked Input for Loop Condition	734	1217
HasMember	B	676	Use of Potentially Dangerous Function	734	1329
HasMember	B	681	Incorrect Conversion between Numeric Types	734	1334
HasMember	C	682	Incorrect Calculation	734	1338

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-20 INT06-C Use strtol() or a related function to convert a string token to an integer CWE-129 INT32-C Ensure that operations on signed integers do not result

in overflow CWE-190 INT03-C Use a secure integer library CWE-190 INT30-C Ensure that unsigned integer operations do not wrap CWE-190 INT32-C Ensure that operations on signed integers do not result in overflow CWE-190 INT35-C Evaluate integer expressions in a larger size before comparing or assigning to that size CWE-192 INT02-C Understand integer conversion rules CWE-192 INT05-C Do not use input functions to convert character data if they cannot handle all possible inputs CWE-192 INT31-C Ensure that integer conversions do not result in lost or misinterpreted data CWE-197 INT02-C Understand integer conversion rules CWE-197 INT05-C Do not use input functions to convert character data if they cannot handle all possible inputs CWE-197 INT31-C Ensure that integer conversions do not result in lost or misinterpreted data CWE-369 INT33-C Ensure that division and modulo operations do not result in divide-by-zero errors CWE-466 INT11-C Take care when converting from pointer to integer or integer to pointer CWE-587 INT11-C Take care when converting from pointer to integer or integer to pointer CWE-606 INT03-C Use a secure integer library CWE-676 INT06-C Use strtol() or a related function to convert a string token to an integer CWE-681 INT15-C Use intmax_t or uintmax_t for formatted IO on programmer-defined integer types CWE-681 INT31-C Ensure that integer conversions do not result in lost or misinterpreted data CWE-681 INT35-C Evaluate integer expressions in a larger size before comparing or assigning to that size CWE-682 INT07-C Use only explicitly signed or unsigned char type for numeric values CWE-682 INT13-C Use bitwise operators only on unsigned operands

Category-739: CERT C Secure Coding Standard (2008) Chapter 6 - Floating Point (FLP)

Category ID : 739

Status: Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Floating Point (FLP) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	734	Page
MemberOf		734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1917
HasMember		369	Divide By Zero	734	826
HasMember		681	Incorrect Conversion between Numeric Types	734	1334
HasMember		682	Incorrect Calculation	734	1338
HasMember		686	Function Call With Incorrect Argument Type	734	1346

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-369 FLP03-C Detect and handle floating point errors CWE-681 FLP33-C Convert integers to floating point for floating point operations CWE-681 FLP34-C Ensure that floating point conversions are within range of the new type CWE-682 FLP32-C Prevent or detect domain and range errors in math functions CWE-682 FLP33-C Convert integers to floating point for floating point operations CWE-686 FLP31-C Do not call functions expecting real values with complex values

HasMember	G	754	Improper Check for Unusual or Exceptional Conditions	734	1394

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-20 MEM10-C Define and use a pointer validation function
 CWE-119 MEM09-C Do not assume memory allocation routines initialize memory
 CWE-128 MEM07-C Ensure that the arguments to `calloc()`, when multiplied, can be represented as a `size_t`
 CWE-131 MEM35-C Allocate sufficient memory for an object
 CWE-190 MEM07-C Ensure that the arguments to `calloc()`, when multiplied, can be represented as a `size_t`
 CWE-190 MEM35-C Allocate sufficient memory for an object
 CWE-226 MEM03-C Clear sensitive information stored in reusable resources returned for reuse
 CWE-244 MEM03-C Clear sensitive information stored in reusable resources returned for reuse
 CWE-252 MEM32-C Detect and handle memory allocation errors
 CWE-415 MEM00-C Allocate and free memory in the same module, at the same level of abstraction
 CWE-415 MEM01-C Store a new value in pointers immediately after `free()`
 CWE-415 MEM31-C Free dynamically allocated memory exactly once
 CWE-416 MEM00-C Allocate and free memory in the same module, at the same level of abstraction
 CWE-416 MEM01-C Store a new value in pointers immediately after `free()`
 CWE-416 MEM30-C Do not access freed memory
 CWE-476 MEM32-C Detect and handle memory allocation errors
 CWE-528 MEM06-C Ensure that sensitive data is not written out to disk
 CWE-590 MEM34-C Only free memory allocated dynamically
 CWE-591 MEM06-C Ensure that sensitive data is not written out to disk
 CWE-628 MEM08-C Use `realloc()` only to resize dynamically allocated arrays
 CWE-665 MEM09-C Do not assume memory allocation routines initialize memory
 CWE-687 MEM04-C Do not perform zero length allocations
 CWE-754 MEM32-C Detect and handle memory allocation errors

Category-743: CERT C Secure Coding Standard (2008) Chapter 10 - Input Output (FIO)

Category ID : 743

Status: Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Input Output (FIO) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1917
HasMember	B	22	Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal')	734	31
HasMember	V	37	Path Traversal: '/absolute/pathname/here'	734	74
HasMember	V	38	Path Traversal: '\\absolute\\pathname\\here'	734	76
HasMember	V	39	Path Traversal: 'C:dirname'	734	77
HasMember	B	41	Improper Resolution of Path Equivalence	734	82
HasMember	B	59	Improper Link Resolution Before File Access ('Link Following')	734	108
HasMember	V	62	UNIX Hard Link	734	115
HasMember	V	64	Windows Shortcut Following (.LNK)	734	117
HasMember	V	65	Windows Hard Link	734	119
HasMember	V	67	Improper Handling of Windows Device Names	734	122
HasMember	G	119	Improper Restriction of Operations within the Bounds of a Memory Buffer	734	276
HasMember	B	134	Use of Externally-Controlled Format String	734	340
HasMember	B	241	Improper Handling of Unexpected Data Type	734	542
HasMember	B	276	Incorrect Default Permissions	734	612
HasMember	V	279	Incorrect Execution-Assigned Permissions	734	618
HasMember	G	362	Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition')	734	801
HasMember	B	367	Time-of-check Time-of-use (TOCTOU) Race Condition	734	820
HasMember	V	379	Creation of Temporary File in Directory with Incorrect Permissions	734	841
HasMember	B	391	Unchecked Error Condition	734	857
HasMember	B	403	Exposure of File Descriptor to Unintended Control Sphere ('File Descriptor Leak')	734	883
HasMember	G	404	Improper Resource Shutdown or Release	734	885
HasMember	B	552	Files or Directories Accessible to External Parties	734	1133
HasMember	G	675	Duplicate Operations on Resource	734	1328
HasMember	B	676	Use of Potentially Dangerous Function	734	1329
HasMember	V	686	Function Call With Incorrect Argument Type	734	1346
HasMember	G	732	Incorrect Permission Assignment for Critical Resource	734	1380

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-22 FIO02-C Canonicalize path names originating from untrusted sources CWE-37 FIO05-C Identify files using multiple file attributes CWE-38 FIO05-C Identify files using multiple file attributes CWE-39 FIO05-C Identify files using multiple file attributes CWE-41 FIO02-C Canonicalize path names originating from untrusted sources CWE-59 FIO02-C Canonicalize path names originating from untrusted sources CWE-62 FIO05-C Identify files using multiple file attributes CWE-64 FIO05-C Identify files using multiple file attributes CWE-65 FIO05-C Identify files using multiple file attributes CWE-67 FIO32-C Do not perform operations on devices that are only appropriate for files CWE-119 FIO37-C Do not assume character data has been read CWE-134 FIO30-C Exclude user input from format strings CWE-134 FIO30-C Exclude user input from format strings CWE-241 FIO37-C Do not assume character data has been read CWE-276 FIO06-C Create files with appropriate access permissions CWE-279 FIO06-C Create files with appropriate access permissions CWE-362 FIO31-C Do not simultaneously open the same file multiple times CWE-367 FIO01-C Be careful using functions that use file names for identification CWE-379 FIO15-C Ensure that file operations are performed in a secure directory CWE-379 FIO43-C Do not create temporary files in shared directories CWE-391 FIO04-C Detect and handle input and output errors CWE-391 FIO33-C Detect and handle input output errors resulting in undefined behavior CWE-403 FIO42-C Ensure files are properly closed when they are no longer needed CWE-404 FIO42-C Ensure files are properly closed when they are no longer needed CWE-552 FIO15-C Ensure that file operations are performed in a secure directory CWE-675 FIO31-C Do not simultaneously open the same file multiple times CWE-676 FIO01-C Be careful using functions that use file names for identification CWE-686 FIO00-C Take care when creating format strings CWE-732 FIO06-C Create files with appropriate access permissions

Category-744: CERT C Secure Coding Standard (2008) Chapter 11 - Environment (ENV)

Category ID : 744

Status: Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Environment (ENV) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	734	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1917
HasMember	B	78	Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection')	734	144
HasMember	B	88	Improper Delimitation of Arguments in a Command ('Argument Injection')	734	186
HasMember	C	119	Improper Restriction of Operations within the Bounds of a Memory Buffer	734	276
HasMember	B	426	Untrusted Search Path	734	926
HasMember	B	462	Duplicate Key in Associative List (Alist)	734	991
HasMember	C	705	Incorrect Control Flow Scoping	734	1372

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-78 ENV03-C Sanitize the environment when invoking external programs CWE-78 ENV04-C Do not call system() if you do not need a command processor CWE-88 ENV03-C Sanitize the environment when invoking external programs CWE-88 ENV04-C Do not call system() if you do not need a command processor CWE-119 ENV01-C Do not make assumptions about the size of an environment variable CWE-426 ENV03-C Sanitize the environment when invoking external programs CWE-462 ENV02-C Beware of multiple environment variables with the same effective name CWE-705 ENV32-C All atexit handlers must return normally

Category-745: CERT C Secure Coding Standard (2008) Chapter 12 - Signals (SIG)

Category ID : 745

Status: Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Signals (SIG) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	Page
MemberOf		734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734 1917
HasMember		479	Signal Handler Use of a Non-reentrant Function	734 1028
HasMember		662	Improper Synchronization	734 1300

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-432 SIG00-C Mask signals handled by noninterruptible signal handlers CWE-479 SIG30-C Call only asynchronous-safe functions within signal handlers CWE-479 SIG32-C Do not call longjmp() from inside a signal handler CWE-479 SIG33-C Do not recursively invoke the raise() function CWE-479 SIG34-C Do not call signal() from within interruptible signal handlers CWE-662 SIG00-C Mask signals handled by noninterruptible signal handlers CWE-662 SIG31-C Do not access or modify shared objects in signal handlers CWE-828 SIG31-C Do not access or modify shared objects in signal handlers

Category-746: CERT C Secure Coding Standard (2008) Chapter 13 - Error Handling (ERR)

Category ID : 746

Status: Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Error Handling (ERR) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1917
HasMember	C	20	Improper Input Validation	734	18
HasMember	B	391	Unchecked Error Condition	734	857
HasMember	B	544	Missing Standardized Error Handling Mechanism	734	1125
HasMember	B	676	Use of Potentially Dangerous Function	734	1329
HasMember	C	705	Incorrect Control Flow Scoping	734	1372

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-20 ERR07-C Prefer functions that support error checking over equivalent functions that don't CWE-391 ERR00-C Adopt and implement a consistent and comprehensive error-handling policy CWE-544 ERR00-C Adopt and implement a consistent and comprehensive error-handling policy CWE-676 ERR07-C Prefer functions that support error checking over equivalent functions that don't CWE-705 ERR04-C Choose an appropriate termination strategy

Category-747: CERT C Secure Coding Standard (2008) Chapter 14 - Miscellaneous (MSC)

Category ID : 747

Status: Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Miscellaneous (MSC) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1917
HasMember	V	14	Compiler Removal of Code to Clear Buffers	734	13
HasMember	C	20	Improper Input Validation	734	18
HasMember	V	176	Improper Handling of Unicode Encoding	734	416
HasMember	C	330	Use of Insufficiently Random Values	734	738
HasMember	B	480	Use of Incorrect Operator	734	1031
HasMember	V	482	Comparing instead of Assigning	734	1037
HasMember	B	561	Dead Code	734	1141
HasMember	V	563	Assignment to Variable without Use	734	1146
HasMember	V	570	Expression is Always False	734	1156
HasMember	V	571	Expression is Always True	734	1159

Nature	Type	ID	Name	V	Page
HasMember		697	Incorrect Comparison	734	1362
HasMember		704	Incorrect Type Conversion or Cast	734	1370

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-14 MSC06-C Be aware of compiler optimization when dealing with sensitive data CWE-20 MSC08-C Library functions should validate their parameters CWE-176 MSC10-C Character Encoding - UTF8 Related Issues CWE-330 MSC30-C Do not use the rand() function for generating pseudorandom numbers CWE-480 MSC02-C Avoid errors of omission CWE-480 MSC03-C Avoid errors of addition CWE-482 MSC02-C Avoid errors of omission CWE-561 MSC07-C Detect and remove dead code CWE-563 MSC00-C Compile cleanly at high warning levels CWE-570 MSC00-C Compile cleanly at high warning levels CWE-571 MSC00-C Compile cleanly at high warning levels CWE-697 MSC31-C Ensure that return values are compared against the proper type CWE-704 MSC31-C Ensure that return values are compared against the proper type CWE-758 MSC14-C Do not introduce unnecessary platform dependencies CWE-758 MSC15-C Do not depend on undefined behavior

Category-748: CERT C Secure Coding Standard (2008) Appendix - POSIX (POS)

Category ID : 748

Status: Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the POSIX (POS) appendix of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	V	Page
MemberOf		734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1917
HasMember		59	Improper Link Resolution Before File Access ('Link Following')	734	108
HasMember		170	Improper Null Termination	734	404
HasMember		242	Use of Inherently Dangerous Function	734	544
HasMember		272	Least Privilege Violation	734	604
HasMember		273	Improper Check for Dropped Privileges	734	608
HasMember		363	Race Condition Enabling Link Following	734	809
HasMember		366	Race Condition within a Thread	734	817
HasMember		562	Return of Stack Variable Address	734	1144
HasMember		667	Improper Locking	734	1311
HasMember		686	Function Call With Incorrect Argument Type	734	1346
HasMember		696	Incorrect Behavior Order	734	1361

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-59 POS01-C Check for the existence of links when dealing with files CWE-170 POS30-C Use the readlink() function properly CWE-242 POS33-C Do not use vfork() CWE-272 POS02-C Follow the principle of least privilege CWE-273 POS37-C Ensure that privilege relinquishment is successful CWE-363 POS35-C Avoid race conditions while checking for the existence of a symbolic link CWE-366 POS00-C Avoid race conditions with multiple threads CWE-562 POS34-C Do not call putenv() with a pointer to an automatic variable as the argument CWE-667 POS31-C Do not unlock or destroy another thread's mutex CWE-686 POS34-C Do not call putenv() with a pointer to an automatic variable as the argument CWE-696 POS36-C Observe correct revocation order while relinquishing privileges

Category-840: Business Logic Errors

Category ID : 840

Status: Incomplete

Summary

Weaknesses in this category identify some of the underlying problems that commonly allow attackers to manipulate the business logic of an application. Errors in business logic can be devastating to an entire application. They can be difficult to find automatically, since they typically involve legitimate use of the application's functionality. However, many business logic errors can exhibit patterns that are similar to well-understood implementation and design weaknesses.

HasMember	C	799	Improper Control of Interaction Frequency	699	1509
HasMember	B	841	Improper Enforcement of Behavioral Workflow	699	1575

Notes

Research Gap

The classification of business logic flaws has been under-studied, although exploitation of business flaws frequently happens in real-world systems, and many applied vulnerability researchers investigate them. The greatest focus is in web applications. There is debate within the community about whether these problems represent particularly new concepts, or if they are variations of well-known principles. Many business logic flaws appear to be oriented toward business processes, application flows, and sequences of behaviors, which are not as well-represented in CWE as weaknesses related to input validation, memory management, etc.

Category-937: OWASP Top Ten 2013 Category A9 - Using Components with Known Vulnerabilities

Category ID : 937 Status: Obsolete

Summary

Weaknesses in this category are related to the A9 category in the OWASP Top Ten 2013.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	928	Weaknesses in OWASP Top Ten (2013)	928	1930

Notes

Relationship

This is an unusual category. CWE does not cover the limitations of human processes and procedures that cannot be described in terms of a specific technical weakness as resident in the code, architecture, or configuration of the software. Since "known vulnerabilities" can arise from any kind of weakness, it is not possible to map this OWASP category to other CWE entries, since it would effectively require mapping this category to ALL weaknesses.

Category-944: SFP Secondary Cluster: Access Management

Category ID : 944

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Access Management cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	899	SFP Primary Cluster: Access Control	888	1827
HasMember	G	282	Improper Ownership Management	888	623
HasMember	B	283	Unverified Ownership	888	624
HasMember	G	284	Improper Access Control	888	626

Nature	Type	ID	Name	V	Page
HasMember		286	Incorrect User Management	888	635
HasMember		708	Incorrect Ownership Assignment	888	1376

Category-945: SFP Secondary Cluster: Insecure Resource Access

Category ID : 945

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Insecure Resource Access cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf		899	SFP Primary Cluster: Access Control	888	1827
HasMember		285	Improper Authorization	888	629

HasMember		639	Authorization Bypass Through User-Controlled Key	888	1262
HasMember		650	Trusting HTTP Permission Methods on the Server Side	888	1286

Category-946: SFP Secondary Cluster: Insecure Resource Permissions

Category ID : 946

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Insecure Resource Permissions cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf		899	SFP Primary Cluster: Access Control	888	1827
HasMember		276	Incorrect Default Permissions	888	612
HasMember		277	Insecure Inherited Permissions	888	615
HasMember		278	Insecure Preserved Inherited Permissions	888	616
HasMember		279	Incorrect Execution-Assigned Permissions	888	618
HasMember		281	Improper Preservation of Permissions	888	621
HasMember		560	Use of umask() with chmod-style Argument	888	1140
HasMember		732	Incorrect Permission Assignment for Critical Resource	888	1380

Category-947: SFP Secondary Cluster: Authentication Bypass

Category ID : 947

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Authentication Bypass cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1827
HasMember	G	287	Improper Authentication	888	637
HasMember	B	288	Authentication Bypass Using an Alternate Path or Channel	888	643
HasMember	V	289	Authentication Bypass by Alternate Name	888	645
HasMember	B	303	Incorrect Implementation of Authentication Algorithm	888	677
HasMember	B	304	Missing Critical Step in Authentication	888	678
HasMember	B	305	Authentication Bypass by Primary Weakness	888	679
HasMember	B	308	Use of Single-factor Authentication	888	689
HasMember	B	309	Use of Password System for Primary Authentication	888	691
HasMember	B	603	Use of Client-Side Authentication	888	1214

Category-948: SFP Secondary Cluster: Digital Certificate

Category ID : 948

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Digital Certificate cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1827
HasMember	B	296	Improper Following of a Certificate's Chain of Trust	888	660
HasMember	V	297	Improper Validation of Certificate with Host Mismatch	888	663
HasMember	V	298	Improper Validation of Certificate Expiration	888	666
HasMember	B	299	Improper Check for Certificate Revocation	888	668
HasMember	V	593	Authentication Bypass: OpenSSL CTX Object Modified after SSL Objects are Created	888	1193
HasMember	V	599	Missing Validation of OpenSSL Certificate	888	1202

Category-949: SFP Secondary Cluster: Faulty Endpoint Authentication

Category ID : 949

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Faulty Endpoint Authentication cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1827
HasMember	V	293	Using Referer Field for Authentication	888	652
HasMember	V	302	Authentication Bypass by Assumed-Immutable Data	888	675
HasMember	G	345	Insufficient Verification of Data Authenticity	888	767
HasMember	B	346	Origin Validation Error	888	769
HasMember	V	350	Reliance on Reverse DNS Resolution for a Security-Critical Action	888	777
HasMember	B	360	Trust of System Event Data	888	800

Nature	Type	ID	Name	V	Page
HasMember	B	551	Incorrect Behavior Order: Authorization Before Parsing and Canonicalization	888	1132
HasMember	B	565	Reliance on Cookies without Validation and Integrity Checking	888	1149
HasMember	V	647	Use of Non-Canonical URL Paths for Authorization Decisions	888	1280

Category-950: SFP Secondary Cluster: Hardcoded Sensitive Data

Category ID : 950

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Hardcoded Sensitive Data cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1827
HasMember	V	258	Empty Password in Configuration File	888	574
HasMember	B	259	Use of Hard-coded Password	888	575
HasMember	B	321	Use of Hard-coded Cryptographic Key	888	716
HasMember	V	547	Use of Hard-coded, Security-relevant Constants	888	1127

Category-951: SFP Secondary Cluster: Insecure Authentication Policy

Category ID : 951

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Insecure Authentication Policy cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1827
HasMember	V	262	Not Using Password Aging	888	584
HasMember	B	263	Password Aging with Long Expiration	888	585
HasMember	B	521	Weak Password Requirements	888	1096
HasMember	V	556	ASP.NET Misconfiguration: Use of Identity Impersonation	888	1138
HasMember	B	613	Insufficient Session Expiration	888	1228
HasMember	B	645	Overly Restrictive Account Lockout Mechanism	888	1277

Category-952: SFP Secondary Cluster: Missing Authentication

Category ID : 952

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Missing Authentication cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1827
HasMember	B	306	Missing Authentication for Critical Function	888	681
HasMember	V	620	Unverified Password Change	888	1239

Category-953: SFP Secondary Cluster: Missing Endpoint Authentication

Category ID : 953

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Missing Endpoint Authentication cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1827
HasMember	V	422	Unprotected Windows Messaging Channel ('Shatter')	888	920
HasMember	B	425	Direct Request ('Forced Browsing')	888	923

Category-954: SFP Secondary Cluster: Multiple Binds to the Same Port

Category ID : 954

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Multiple Binds to the Same Port cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1827
HasMember	B	605	Multiple Binds to the Same Port	888	1215

Category-955: SFP Secondary Cluster: Unrestricted Authentication

Category ID : 955

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Unrestricted Authentication cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1827
HasMember	B	307	Improper Restriction of Excessive Authentication Attempts	888	685

Category-956: SFP Secondary Cluster: Channel Attack

Category ID : 956

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Channel Attack cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	902	SFP Primary Cluster: Channel	888	1828
HasMember	B	290	Authentication Bypass by Spoofing	888	647
HasMember	B	294	Authentication Bypass by Capture-replay	888	654
HasMember	G	300	Channel Accessible by Non-Endpoint ('Man-in-the-Middle')	888	670
HasMember	V	301	Reflection Attack in an Authentication Protocol	888	673
HasMember	B	419	Unprotected Primary Channel	888	916
HasMember	B	420	Unprotected Alternate Channel	888	917
HasMember	B	421	Race Condition During Access to Alternate Channel	888	919
HasMember	G	441	Unintended Proxy or Intermediary ('Confused Deputy')	888	958

Category-957: SFP Secondary Cluster: Protocol Error

Category ID : 957

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Protocol Error cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	902	SFP Primary Cluster: Channel	888	1828
HasMember	B	353	Missing Support for Integrity Check	888	788
HasMember	G	435	Improper Interaction Between Multiple Correctly-Behaving Entities	888	951
HasMember	G	436	Interpretation Conflict	888	952
HasMember	B	437	Incomplete Model of Endpoint Features	888	955
HasMember	B	757	Selection of Less-Secure Algorithm During Negotiation ('Algorithm Downgrade')	888	1405

Category-958: SFP Secondary Cluster: Broken Cryptography

Category ID : 958

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Broken Cryptography cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	903	SFP Primary Cluster: Cryptography	888	1828
HasMember	B	325	Missing Required Cryptographic Step	888	723
HasMember	G	327	Use of a Broken or Risky Cryptographic Algorithm	888	727

Nature	Type	ID	Name	V	Page
HasMember	B	328	Reversible One-Way Hash	888	733
HasMember	V	759	Use of a One-Way Hash without a Salt	888	1408
HasMember	V	760	Use of a One-Way Hash with a Predictable Salt	888	1413

Category-959: SFP Secondary Cluster: Weak Cryptography

Category ID : 959

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Weak Cryptography cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	903	SFP Primary Cluster: Cryptography	888	1828
HasMember	V	261	Weak Cryptography for Passwords	888	582
HasMember	B	322	Key Exchange without Entity Authentication	888	718
HasMember	V	323	Reusing a Nonce, Key Pair in Encryption	888	720
HasMember	B	324	Use of a Key Past its Expiration Date	888	722
HasMember	G	326	Inadequate Encryption Strength	888	725
HasMember	V	329	Not Using a Random IV with CBC Mode	888	736
HasMember	B	347	Improper Verification of Cryptographic Signature	888	772
HasMember	B	640	Weak Password Recovery Mechanism for Forgotten Password	888	1264

Category-960: SFP Secondary Cluster: Ambiguous Exception Type

Category ID : 960

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Ambiguous Exception Type cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	889	SFP Primary Cluster: Exception Management	888	1824
HasMember	B	396	Declaration of Catch for Generic Exception	888	867
HasMember	B	397	Declaration of Throws for Generic Exception	888	869

Category-961: SFP Secondary Cluster: Incorrect Exception Behavior

Category ID : 961

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Incorrect Exception Behavior cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	889	SFP Primary Cluster: Exception Management	888	1824
HasMember	B	392	Missing Report of Error Condition	888	860
HasMember	B	393	Return of Wrong Status Code	888	862
HasMember	B	455	Non-exit on Failed Initialization	888	978
HasMember	V	460	Improper Cleanup on Thrown Exception	888	989
HasMember	B	544	Missing Standardized Error Handling Mechanism	888	1125
HasMember	B	584	Return Inside Finally Block	888	1181
HasMember	C	636	Not Failing Securely ('Failing Open')	888	1256
HasMember	C	703	Improper Check or Handling of Exceptional Conditions	888	1368

Category-962: SFP Secondary Cluster: Unchecked Status Condition

Category ID : 962

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Unchecked Status Condition cluster.

Membership

Nature	Type	ID	Name	V	Page

Category-964: SFP Secondary Cluster: Exposure Temporary File

Category ID : 964

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Exposure Temporary File cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	895	SFP Primary Cluster: Information Leak	888	1826
HasMember	B	377	Insecure Temporary File	888	837
HasMember	B	378	Creation of Temporary File With Insecure Permissions	888	839
HasMember	V	379	Creation of Temporary File in Directory with Incorrect Permissions	888	841

Category-965: SFP Secondary Cluster: Insecure Session Management

Category ID : 965

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Insecure Session Management cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	895	SFP Primary Cluster: Information Leak	888	1826
HasMember	V	6	J2EE Misconfiguration: Insufficient Session-ID Length	888	2
HasMember	V	488	Exposure of Data Element to Wrong Session	888	1047
HasMember	V	524	Information Exposure Through Caching	888	1103

Category-966: SFP Secondary Cluster: Other Exposures

Category ID : 966

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Other Exposures cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	895	SFP Primary Cluster: Information Leak	888	1826
HasMember	V	453	Insecure Default Variable Initialization	888	974
HasMember	V	487	Reliance on Package-level Scope	888	1046
HasMember	V	492	Use of Inner Class Containing Sensitive Data	888	1053
HasMember	V	525	Information Exposure Through Browser Caching	888	1104
HasMember	V	614	Sensitive Cookie in HTTPS Session Without 'Secure' Attribute	888	1230
HasMember	V	651	Information Exposure Through WSDL File	888	1287

Category-967: SFP Secondary Cluster: State Disclosure

Category ID : 967

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the State Disclosure cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	895	SFP Primary Cluster: Information Leak	888	1826

HasMember	V	207	Information Exposure Through an External Behavioral Inconsistency	888	494
HasMember	B	208	Information Exposure Through Timing Discrepancy	888	495

Category-968: SFP Secondary Cluster: Covert Channel

Category ID : 968

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Covert Channel cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	904	SFP Primary Cluster: Malware	888	1828
HasMember	B	385	Covert Timing Channel	888	850
HasMember	C	514	Covert Channel	888	1092
HasMember	B	515	Covert Storage Channel	888	1094

Category-969: SFP Secondary Cluster: Faulty Memory Release

Category ID : 969

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Faulty Memory Release cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	891	SFP Primary Cluster: Memory Management	888	1824
HasMember	V	415	Double Free	888	909
HasMember	V	590	Free of Memory not on the Heap	888	1189
HasMember	V	761	Free of Pointer not at Start of Buffer	888	1416
HasMember	V	762	Mismatched Memory Management Routines	888	1419
HasMember	B	763	Release of Invalid Pointer or Reference	888	1422

Category-970: SFP Secondary Cluster: Faulty Buffer Access

Category ID : 970

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Faulty Buffer Access cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	890	SFP Primary Cluster: Memory Access	888	1824
HasMember	G	118	Incorrect Access of Indexable Resource ('Range Error')	888	275
HasMember	G	119	Improper Restriction of Operations within the Bounds of a Memory Buffer	888	276
HasMember	B	120	Buffer Copy without Checking Size of Input ('Classic Buffer Overflow')	888	286
HasMember	V	121	Stack-based Buffer Overflow	888	295
HasMember	V	122	Heap-based Buffer Overflow	888	298
HasMember	B	123	Write-what-where Condition	888	301
HasMember	B	124	Buffer Underwrite ('Buffer Underflow')	888	304

HasMember	V	588	Attempt to Access Child of a Non-structure Pointer	888	1187

Category-972: SFP Secondary Cluster: Faulty String Expansion

Category ID : 972

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Faulty String Expansion cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	890	SFP Primary Cluster: Memory Access	888	1824
HasMember	V	785	Use of Path Manipulation Function without Maximum-sized Buffer	888	1473

Category-973: SFP Secondary Cluster: Improper NULL Termination

Category ID : 973

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Improper NULL Termination cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	890	SFP Primary Cluster: Memory Access	888	1824
HasMember	B	170	Improper Null Termination	888	404

Category-974: SFP Secondary Cluster: Incorrect Buffer Length Computation

Category ID : 974

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Incorrect Buffer Length Computation cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	890	SFP Primary Cluster: Memory Access	888	1824
HasMember	B	131	Incorrect Calculation of Buffer Size	888	331
HasMember	B	135	Incorrect Calculation of Multi-Byte String Length	888	345
HasMember	V	467	Use of sizeof() on a Pointer Type	888	998

Category-975: SFP Secondary Cluster: Architecture

Category ID : 975

Status: Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Architecture cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	907	SFP Primary Cluster: Other	888	1830
HasMember	B	348	Use of Less Trusted Source	888	774

Category-1005: 7PK - Input Validation and Representation

Category ID : 1005

Status: Draft

Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that exist when an application does not properly validate or represent input. According to the authors of the Seven Pernicious Kingdoms, "Input validation and representation problems are caused by metacharacters, alternate encodings and numeric representations. Security problems result from trusting input."

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	700	Seven Pernicious Kingdoms	700	1914
HasMember	C	20	Improper Input Validation	700	18
HasMember	C	77	Improper Neutralization of Special Elements used in a Command ('Command Injection')	700	139
HasMember	B	79	Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting')	700	156
HasMember	B	89	Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection')	700	191
HasMember	B	99	Improper Control of Resource Identifiers ('Resource Injection')	700	230

Category-1006: Bad Coding Practices

Category ID : 1006

Status: Draft

Summary

Weaknesses in this category are related to coding practices that are deemed unsafe and increase the chances that an exploitable vulnerability will be present in the application. These weaknesses do not directly introduce a vulnerability, but indicate that the product has not been carefully developed or maintained. If a program is complex, difficult to maintain, not portable, or shows evidence of neglect, then there is a higher likelihood that weaknesses are buried in the code.

Category-1009: Audit

Category ID : 1009

Status: Draft

Summary

Weaknesses in this category are related to the design and architecture of audit-based components of the system. Frequently these deal with logging user activities in order to identify attackers and modifications to the system. The weaknesses in this category could lead to a degradation of the quality of the audit capability if they are not addressed when designing or implementing a secure architecture.

Category-1010: Authenticate Actors

Category ID : 1010

Status: Draft

Summary

Weaknesses in this category are related to the design and architecture of authentication components of the system. Frequently these deal with verifying the entity is indeed who it claims to be. The weaknesses in this category could lead to a degradation of the quality of authentication if they are not addressed when designing or implementing a secure architecture.

Category-1011: Authorize Actors

Category ID : 1011

Status: Draft

Summary

Weaknesses in this category are related to the design and architecture of a system's authorization components. Frequently these deal with enforcing that agents have the required permissions before performing certain operations, such as modifying data. The weaknesses in this category could lead to a degradation of quality of the authorization capability if they are not addressed when designing or implementing a secure architecture.

Category-1012: Cross Cutting

Category ID : 1012

Status: Draft

Summary

Weaknesses in this category are related to the design and architecture of multiple security tactics and how they affect a system. For example, information exposure can impact the Limit Access and Limit Exposure security tactics. The weaknesses in this category could lead to a degradation of the quality of many capabilities if they are not addressed when designing or implementing a secure architecture.

Category-1013: Encrypt Data

Category ID : 1013

Status: Draft

Summary

Weaknesses in this category are related to the design and architecture of data confidentiality in a system. Frequently these deal with the use of encryption libraries. The weaknesses in this category could lead to a degradation of the quality data encryption if they are not addressed when designing or implementing a secure architecture.

Category-1014: Identify Actors

Category ID : 1014

Status: Draft

Summary

Weaknesses in this category are related to the design and architecture of a system's identification management components. Frequently these deal with verifying that external agents provide inputs into the system. The weaknesses in this category could lead to a degradation of the quality of identification management if they are not addressed when designing or implementing a secure architecture.

Category-1015: Limit Access

Category ID : 1015

Status: Draft

Summary

Weaknesses in this category are related to the design and architecture of system resources. Frequently these deal with restricting the amount of resources that are accessed by actors, such as memory, network connections, CPU or access points. The weaknesses in this category could lead to a degradation of the quality of authentication if they are not addressed when designing or implementing a secure architecture.

Category-1016: Limit Exposure

Category ID : 1016

Status: Draft

Summary

Weaknesses in this category are related to the design and architecture of the entry points to a system. Frequently these deal with minimizing the attack surface through designing the system with the least needed amount of entry points. The weaknesses in this category could lead to a degradation of a system's defenses if they are not addressed when designing or implementing a secure architecture.

Category-1017: Lock Computer

Category ID : 1017

Status: Draft

Summary

Weaknesses in this category are related to the design and architecture of a system's lockout mechanism. Frequently these deal with scenarios that take effect in case of multiple failed attempts to access a given resource. The weaknesses in this category could lead to a degradation of access to system assets if they are not addressed when designing or implementing a secure architecture.

Category-1018: Manage User Sessions

Category ID : 1018

Status: Draft

Summary

Weaknesses in this category are related to the design and architecture of session management. Frequently these deal with the information or status about each user and their access rights for the duration of multiple requests. The weaknesses in this category could lead to a degradation of the quality of session management if they are not addressed when designing or implementing a secure architecture.

Category-1019: Validate Inputs

Category ID : 1019

Status: Draft

Summary

Weaknesses in this category are related to the design and architecture of a system's input validation components. Frequently these deal with sanitizing, neutralizing and validating any externally provided inputs to minimize malformed data from entering the system and preventing code injection in the input data. The weaknesses in this category could lead to a degradation of the quality of data flow in a system if they are not addressed when designing or implementing a secure architecture.

Category-1020: Verify Message Integrity

Category ID : 1020

Status: Draft

Summary

Weaknesses in this category are related to the design and architecture of a system's data integrity components. Frequently these deal with ensuring integrity of data, such as messages, resource files, deployment files, and configuration files. The weaknesses in this category could lead to a degradation of data integrity quality if they are not addressed when designing or implementing a secure architecture.

Category-1032: OWASP Top Ten 2017 Category A6 - Security Misconfiguration

Category ID : 1032

Status: Incomplete

Summary

Weaknesses in this category are related to the A6 category in the OWASP Top Ten 2017.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	1026	Weaknesses in OWASP Top Ten (2017)	1026	1936
HasMember	C	16	Configuration	1026	1748
HasMember	B	209	Information Exposure Through an Error Message	1026	497
HasMember	V	548	Information Exposure Through Directory Listing	1026	1129

Notes

Relationship

While the OWASP document maps to CWE-2 and CWE-388, these are not appropriate for mapping, as they are high-level categories that are only intended for the Seven Pernicious Kingdoms view (CWE-700).

Category-1035: OWASP Top Ten 2017 Category A9 - Using Components with Known Vulnerabilities

Category ID : 1035 **Status:** Incomplete

Summary

Weaknesses in this category are related to the A9 category in the OWASP Top Ten 2017.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	1026	Weaknesses in OWASP Top Ten (2017)	1026	1936

Notes

Relationship

This is an unusual category. CWE does not cover the limitations of human processes and procedures that cannot be described in terms of a specific technical weakness as resident in the code, architecture, or configuration of the software. Since "known vulnerabilities" can arise from any kind of weakness, it is not possible to map this OWASP category to other CWE entries, since it would effectively require mapping this category to ALL weaknesses.

View-629: Weaknesses in OWASP Top Ten (2007)

View ID : 629

Status: Obsolete

Type : Graph

Objective

CWE nodes in this view (graph) are associated with the OWASP Top Ten, as released in 2007. This view is considered obsolete as a newer version of the OWASP Top Ten is available.

Audience**Software Developers**

This view outlines the most important issues as identified by the OWASP Top Ten (2007 version), providing a good starting point for web application developers who want to code more securely.

Software Customers

This view outlines the most important issues as identified by the OWASP Top Ten (2007 version), providing customers with a way of asking their software developers to follow minimum expectations for secure code.

Educators

Since the OWASP Top Ten covers the most frequently encountered issues, this view can be used by educators as training material for students.

Notes

Maintenance

This view is effectively obsolete, although it is probably still in active use by CWE consumers. In Summer 2007, NIST began using this set of CWE elements to classify CVE entries within the National Vulnerability Database (NVD). The data was made publicly available beginning in 2008. In 2016, NIST began using a different list as derived from the "Weaknesses for Simplified Mapping of Published Vulnerabilities" view (CWE-1003).

View-699: Development Concepts

View ID : 699

Status: Incomplete

Type : Graph

Objective

This view organizes weaknesses around concepts that are frequently used or encountered in software development. Accordingly, this view can align closely with the perspectives of developers, educators, and assessment vendors. It provides a variety of categories that are intended to simplify navigation, browsing, and mapping.

Audience

Software Developers

Software developers use this view to better understand potential mistakes that can be made in specific areas of their code. The use of concepts that developers are familiar with makes it easier to navigate.

Educators

Educators use this view to teach future developers about the types of mistakes that are commonly made within specific parts of a codebase.

View-700: Seven Pernicious Kingdoms

View ID : 700

Status: Incomplete

Type : Graph

Objective

This view (graph) organizes weaknesses using a hierarchical structure that is similar to that used by Seven Pernicious Kingdoms.

Audience

Software Developers

This view is useful for developers because it is organized around concepts with which developers are familiar, and it focuses on weaknesses that can be detected using source code analysis tools.

Membership

Nature	Type	ID	Name	Page
HasMember		2	7PK - Environment	1747

View-711: Weaknesses in OWASP Top Ten (2004)

View ID : 711

Status: Obsolete

Type : Graph

Objective

CWE nodes in this view (graph) are associated with the OWASP Top Ten, as released in 2004, and as required for compliance with PCI DSS version 1.1. This view is considered obsolete as a newer version of the OWASP Top Ten is available.

Audience

Software Developers

This view outlines the most important issues as identified by the OWASP Top Ten (2004 version), providing a good starting point for web application developers who want to code more securely, as well as complying with PCI DSS 1.1.

Software Customers

This view outlines the most important issues as identified by the OWASP Top Ten, providing customers with a way of asking their software developers to follow minimum expectations for secure code, in compliance with PCI-DSS 1.1.

Educators

Since the OWASP Top Ten covers the most frequently encountered issues, this view can be used by educators as training material for students. However, the 2007 version (CWE-629) might be more appropriate.

Membership

Nature	Type	ID	Name	Page
HasMember		722	OWASP Top Ten 2004 Category A1 - Unvalidated Input	1776

HasMember		731	OWASP Top Ten 2004 Category A10 - Insecure Configuration Management	1781

Notes

Relationship

CWE relationships for this view were obtained by examining the OWASP document and mapping to any items that were specifically mentioned within the text of a category. As a result, this mapping is not complete with respect to all of CWE. In addition, some concepts were mentioned in multiple

Top Ten items, which caused them to be mapped to multiple CWE categories. For example, SQL injection is mentioned in both A1 (CWE-722) and A6 (CWE-727) categories.

Maintenance

Some parts of CWE are not fully fleshed out in terms of weaknesses. When these areas were mentioned in the Top Ten, category nodes were mapped, although general mapping practice would usually favor mapping only to weaknesses.

View-734: Weaknesses Addressed by the CERT C Secure Coding Standard (2008)

View ID : 734

Status: Obsolete

Type : Graph

Objective

CWE entries in this view (graph) are fully or partially eliminated by following the guidance presented in the book "The CERT C Secure Coding Standard" published in 2008. This view is considered obsolete as a newer version of the coding standard is available.

Audience

Software Developers

By following the CERT C Secure Coding Standard, developers will be able to fully or partially prevent the weaknesses that are identified in this view. In addition, developers can use a CWE coverage graph to determine which weaknesses are not directly addressed by the standard, which will help identify and resolve remaining gaps in training, tool acquisition, or other approaches for reducing weaknesses.

Software Customers

If a software developer claims to be following the CERT C Secure Coding standard, then customers can search for the weaknesses in this view in order to formulate independent evidence of that claim.

Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could link them to the relevant Secure Coding Standard.

HasMember	C	748	CERT C Secure Coding Standard (2008) Appendix - POSIX (POS)	1793

Notes

Relationship

The relationships in this view were determined based on specific statements within the rules from the standard. Not all rules have direct relationships to individual weaknesses, although they likely have chaining relationships in specific circumstances.

Maintenance

This view is no longer being actively maintained, since it statically represents the coding rules as they were in 2008.

View-750: Weaknesses in the 2009 CWE/SANS Top 25 Most Dangerous Programming Errors

View ID : 750

Status: Obsolete

Type : Graph**Objective**

CWE entries in this view (graph) are listed in the 2009 CWE/SANS Top 25 Programming Errors. This view is considered obsolete as a newer version of the Top 25 is available.

Audience**Software Developers**

By following the Top 25, developers will be able to significantly reduce the number of weaknesses that occur in their software.

Software Customers

If a software developer claims to be following the Top 25, then customers can search for the weaknesses in this view in order to formulate independent evidence of that claim.

Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could focus on the Top 25.

View-809: Weaknesses in OWASP Top Ten (2010)

View ID : 809

Status: Obsolete

Type : Graph

Objective

CWE nodes in this view (graph) are associated with the OWASP Top Ten, as released in 2010. This view is considered obsolete as a newer version of the OWASP Top Ten is available.

Audience

Software Developers

This view outlines the most important issues as identified by the OWASP Top Ten (2010 version), providing a good starting point for web application developers who want to code more securely.

Software Customers

This view outlines the most important issues as identified by the OWASP Top Ten (2010 version), providing customers with a way of asking their software developers to follow minimum expectations for secure code.

Educators

Since the OWASP Top Ten covers the most frequently encountered issues, this view can be used by educators as training material for students.

Membership

HasMember	C	819	OWASP Top Ten 2010 Category A10 - Unvalidated Redirects and Forwards	1802

Notes

Relationship

The relationships in this view are a direct extraction of the CWE mappings that are in the 2010 OWASP document. CWE has changed since the release of that document.

View-844: Weaknesses Addressed by The CERT Oracle Secure Coding Standard for Java (2011)

View ID : 844

Status: Obsolete

Type : Graph

Objective

CWE entries in this view (graph) are fully or partially eliminated by following the guidance presented in the book "The CERT Oracle Secure Coding Standard for Java" published in 2011. This view is considered obsolete as a newer version of the coding standard is available.

Audience

Software Developers

By following The CERT Oracle Secure Coding Standard for Java, developers will be able to fully or partially prevent the weaknesses that are identified in this view. In addition, developers can use a CWE coverage graph to determine which weaknesses are not directly addressed by the standard, which will help identify and resolve remaining gaps in training, tool acquisition, or other approaches for reducing weaknesses.

Software Customers

If a software developer claims to be following The CERT Oracle Secure Coding Standard for Java, then customers can search for the weaknesses in this view in order to formulate independent evidence of that claim.

Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could link them to the relevant Secure Coding Standard.

HasMember		861	The CERT Oracle Secure Coding Standard for Java (2011) Chapter 18 - Miscellaneous (MSC)	1812

Notes

Relationship

The relationships in this view were determined based on specific statements within the rules from the standard. Not all rules have direct relationships to individual weaknesses, although they likely have chaining relationships in specific circumstances.

View-868: Weaknesses Addressed by the SEI CERT C++ Coding Standard (2016 Version)

View ID : 868

Status: Obsolete

Type : Graph

Objective

CWE entries in this view (graph) are fully or partially eliminated by following the SEI CERT C++ Coding Standard, as published in 2016.

Audience**Software Developers**

By following the CERT C++ Secure Coding Standard, developers will be able to fully or partially prevent the weaknesses that are identified in this view. In addition, developers can use a CWE coverage graph to determine which weaknesses are not directly addressed by the standard, which will help identify and resolve remaining gaps in training, tool acquisition, or other approaches for reducing weaknesses.

Software Customers

If a software developer claims to be following the CERT C++ Secure Coding Standard, then customers can search for the weaknesses in this view in order to formulate independent evidence of that claim.

Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could link them to the relevant Secure Coding Standard.

View-884: CWE Cross-section

View ID : 884	Status : Incomplete
Type : Explicit	

Objective

This view contains a selection of weaknesses that represent the variety of weaknesses that are captured in CWE, at a level of abstraction that is likely to be useful to most audiences. It can be used by researchers to determine how broad their theories, models, or tools are. It will also be used by the CWE content team in 2012 to focus quality improvement efforts for individual CWE entries.

View-900: Weaknesses in the 2011 CWE/SANS Top 25 Most Dangerous Software Errors

View ID : 900

Status: Obsolete

Type : Graph

Objective

CWE entries in this view (graph) are listed in the 2011 CWE/SANS Top 25 Most Dangerous Software Errors.

Audience

Software Developers

By following the Top 25, developers will be able to significantly reduce the number of weaknesses that occur in their software.

Software Customers

If a software developer claims to be following the Top 25, then customers can use the weaknesses in this view in order to formulate independent evidence of that claim.

Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could focus on the Top 25.

View-928: Weaknesses in OWASP Top Ten (2013)

View ID : 928

Status: Obsolete

Type : Graph

Objective

CWE nodes in this view (graph) are associated with the OWASP Top Ten, as released in 2013. This view is considered obsolete as a newer version of the OWASP Top Ten is available.

Audience

Software Developers

This view outlines the most important issues as identified by the OWASP Top Ten (2013 version), providing a good starting point for web application developers who want to code more securely.

Software Customers

This view outlines the most important issues as identified by the OWASP Top Ten (2013 version), providing customers with a way of asking their software developers to follow minimum expectations for secure code.

Educators

Since the OWASP Top Ten covers the most frequently encountered issues, this view can be used by educators as training material for students.

Membership

Nature	Type	ID	Name	Page

View-999: Weaknesses without Software Fault Patterns

View ID : 999

Status: Incomplete

Type : Implicit

Objective

CWE identifiers in this view are weaknesses that do not have associated Software Fault Patterns (SFPs), as covered by the CWE-888 view. As such, they represent gaps in coverage by the current software fault pattern model.

Audience

Applied Researchers

Academic Researchers

Software Vendors

Filter

View-1000: Research Concepts

View ID : 1000	Status: Draft
Type : Graph	

Objective

This view is intended to facilitate research into weaknesses, including their inter-dependencies, and can be leveraged to systematically identify theoretical gaps within CWE. It classifies weaknesses in a way that largely ignores how they can be detected, where they appear in code, and when they are introduced in the software development life cycle. Instead, it is mainly organized according to abstractions of software behaviors.

Audience

Academic Researchers

Academic researchers can use the high-level classes that lack a significant number of children to identify potential areas for future research.

Vulnerability Analysts

Those who perform vulnerability discovery/analysis use this view to identify related weaknesses that might be leveraged by following relationships between higher-level classes and bases.

Assessment Vendors

Assessment vendors often use this view to help identify additional weaknesses that a tool may be able to detect as the relationships are more aligned with a tool's technical capabilities.

Membership

Nature	Type	ID	Name	Page
HasMember	<input checked="" type="checkbox"/>	118	Incorrect Access of Indexable Resource ('Range Error')	275

Nature	Type	ID	Name	Page

HasMember	🟢	707	Improper Enforcement of Message or Data Structure	1375
HasMember	🟢	710	Improper Adherence to Coding Standards	1378

Notes

Other

This view uses a deep hierarchical organization, with more levels of abstraction than other classification schemes. The top-level entries are called Pillars. Where possible, this view uses abstractions that do not consider particular languages, frameworks, technologies, life cycle development phases, frequency of occurrence, or types of resources. It explicitly identifies relationships that form chains and composites, which have not been a formal part of past classification efforts. Chains and composites might help explain why mutual exclusivity is difficult to achieve within security error taxonomies. This view is roughly aligned with MITRE's research into vulnerability theory, especially with respect to behaviors and resources. Ideally, this view will only cover weakness-to-weakness relationships, with minimal overlap and zero categories.

View-1003: Weaknesses for Simplified Mapping of Published Vulnerabilities

View ID : 1003

Status: Incomplete

Type : Graph

Objective

CWE entries in this view (graph) may be used to categorize potential weaknesses within sources that handle public, third-party vulnerability information, such as the National Vulnerability Database (NVD). By design, this view is incomplete; it is limited to a small number of the most commonly-seen weaknesses, so that it is easier for humans to use. This view uses a shallow hierarchy of two levels in order to simplify the complex, category-oriented navigation of the entire CWE corpus.

View-1008: Architectural Concepts

View ID : 1008

Status: Incomplete

Type : Graph

Objective

This view organizes weaknesses according to common architectural security tactics. It is intended to assist architects in identifying potential mistakes that can be made when designing software.

Audience

Software Designers

Software designers may find this view useful as the weaknesses are organized by known security tactics, aiding the designer in embedding security throughout the design process instead of discovering weaknesses after the software has been built.

Educators

Educators may use this view as reference material when discussing security by design or architectural weaknesses, and the types of mistakes that can be made.

Membership

HasMember	C	1018	Manage User Sessions	1872
HasMember	C	1019	Validate Inputs	1872
HasMember	C	1020	Verify Message Integrity	1874

Notes

Other

The top level categories in this view represent the individual tactics that are part of a secure-by-design approach to software development. The weaknesses that are members of each category contain information about how each is introduced relative to the software's architecture. Three different modes of introduction are used: Omission - caused by missing a security tactic when it is necessary. Commission - refers to incorrect choice of tactics which could result in undesirable consequences. Realization - appropriate security tactics are adopted but are incorrectly implemented.

Maintenance

This view is under development, and subsequent releases will focus on reviewing the individual weaknesses to verify their inclusion in this view and adding any applicable ChildOf relationships. Comments about revisions are welcome.

View-1040: Quality Weaknesses with Indirect Security Impacts

View ID : 1040

Status: Incomplete

Type : Implicit

Objective

CWE identifiers in this view (slice) are quality issues that only indirectly make it easier to introduce a vulnerability and/or make the vulnerability more difficult to detect or mitigate.

Audience

Assessment Vendors

This view makes it easier for assessment vendors to identify and improve coverage for quality-related weaknesses.

Software Developers

This view makes it easier for developers to identify and learn about issues that might make their code more difficult to maintain, perform efficiently or reliably, or secure.

Software Vendors

This view makes it easier for software vendors to identify important issues that may make their software more difficult to maintain, perform efficiently or reliably, or secure.

View-1128: CISQ Quality Measures (2016)

View ID : 1128
Type : Graph

Status: Incomplete

Objective

CWE nodes in this view (graph) are associated with the Consortium for IT Software Quality (CISQ) Automated Quality Characteristic Measures, released in 2016. These measures are derived from Object Management Group (OMG) standards.

Audience

Software Developers

This view outlines the most important software quality issues as identified by the CISQ Automated Quality Characteristic Measures from 2016; it provides a good starting point for application developers who wish to learn more about, or improve their own code quality.

Software Designers

This view outlines the most important software quality issues as identified by the CISQ Automated Quality Characteristic Measures from 2016; it provides a good starting point for software designers to ensure that code quality issues are considered during the design process.

Software Vendors

This view outlines the most important software quality issues as identified by the CISQ Automated Quality Characteristic Measures from 2016; it provides a good starting point for software vendors who wish to mark the quality of their software.

Assessment Vendors

This view outlines the most important software quality issues as identified by the CISQ Automated Quality Characteristic Measures from 2016; it provides a good starting point for assessment vendors who wish to understand what constitutes software with good code quality, using quality issues that are automatically detectable.

View-1133: Weaknesses Addressed by the SEI CERT Oracle Coding Standard for Java

View ID : 1133
Type : Graph

Status: Stable

Objective

CWE entries in this view (graph) are fully or partially eliminated by following the guidance presented in the online wiki that reflects that current rules and recommendations of the SEI CERT Oracle Coding Standard for Java.

Audience

Software Developers

By following the SEI CERT Oracle Coding Standard for Java, developers will be able to fully or partially prevent the weaknesses that are identified in this view. In addition, developers can use a CWE coverage graph to determine which weaknesses are not directly addressed by the standard, which will help identify and resolve remaining gaps in training, tool acquisition, or other approaches for reducing weaknesses.

Software Customers

If a software developer claims to be following the SEI CERT Oracle Secure Coding Standard for Java, then customers can search for the weaknesses in this view in order to formulate independent evidence of that claim.

Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could link them to the relevant Secure Coding Standard.

View-1178: Weaknesses Addressed by the SEI CERT Perl Coding Standard

View ID : 1178

Status: Stable

Type : Graph

Objective

CWE entries in this view (graph) are fully or partially eliminated by following the guidance presented in the online wiki that reflects that current rules and recommendations of the SEI CERT Perl Coding Standard.

Audience

Software Developers

By following the SEI CERT Perl Coding Standard, developers will be able to fully or partially prevent the weaknesses that are identified in this view. In addition, developers can use a CWE coverage graph to determine which weaknesses are not directly addressed by the standard, which will help identify and resolve remaining gaps in training, tool acquisition, or other approaches for reducing weaknesses.

Software Customers

If a software developer claims to be following the SEI CERT Perl Coding Standard, then customers can search for the weaknesses in this view in order to formulate independent evidence of that claim.

Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could link them to the relevant Secure Coding Standard.

Membership

Nature	Type	ID	Name	Page
HasMember	C	1179	SEI CERT Perl Coding Standard - Guidelines 01. Input Validation and Data Sanitization (IDS)	1904
HasMember	C	1180	SEI CERT Perl Coding Standard - Guidelines 02. Declarations and Initialization (DCL)	1904
HasMember	C	1181	SEI CERT Perl Coding Standard - Guidelines 03. Expressions (EXP)	1905
HasMember	C	1182	SEI CERT Perl Coding Standard - Guidelines 04. Integers (INT)	1905
HasMember	C	1183	SEI CERT Perl Coding Standard - Guidelines 05. Strings (STR)	1906
HasMember	C	1184	SEI CERT Perl Coding Standard - Guidelines 06. Object-Oriented Programming (OOP)	1906
HasMember	C	1185	SEI CERT Perl Coding Standard - Guidelines 07. File Input and Output (FIO)	1906
HasMember	C	1186	SEI CERT Perl Coding Standard - Guidelines 50. Miscellaneous (MSC)	1907

Notes

Relationship

The relationships in this view were determined based on specific statements within the rules from the standard. Not all rules have direct relationships to individual weaknesses, although they likely have chaining relationships in specific circumstances.

View-1200: Weaknesses in the 2019 CWE Top 25 Most Dangerous Software Errors

View ID : 1200

Status: Stable

Type : Graph

Objective

CWE entries in this view are listed in the 2019 CWE Top 25 Most Dangerous Software Errors.

Audience

Software Developers

By following the Top 25, developers will be able to significantly reduce the number of weaknesses that occur in their software.

Software Customers

If a software developer claims to be following the Top 25, then customers can use the weaknesses in this view in order to formulate independent evidence of that claim.

Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could focus on the Top 25.

View-2000: Comprehensive CWE Dictionary

View ID : 2000

Status: Draft

Type : Implicit

Objective

This view (slice) covers all the elements in CWE.

Filter

Graph View: CWE-629: Weaknesses in OWASP Top Ten (2007)

- C** CWE-712: OWASP Top Ten 2007 Category A1 - Cross Site Scripting (XSS) (p.1772)
 - B** CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') (p.156)
- C** CWE-713: OWASP Top Ten 2007 Category A2 - Injection Flaws (p.1773)
 - G** CWE-77: Improper Neutralization of Special Elements used in a Command ('Command Injection') (p.139)
 - B** CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') (p.191)
 - B** CWE-90: Improper Neutralization of Special Elements used in an LDAP Query ('LDAP Injection') (p.202)
 - B** CWE-91: XML Injection (aka Blind XPath Injection) (p.204)
 - B** CWE-93: Improper Neutralization of CRLF Sequences ('CRLF Injection') (p.207)
- C** CWE-714: OWASP Top Ten 2007 Category A3 - Malicious File Execution (p.1773)
 - B** CWE-434: Unrestricted Upload of File with Dangerous Type (p.944)
 - B** CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p.144)
 - V** CWE-95: Improper Neutralization of Directives in Dynamically Evaluated Code ('Eval Injection') (p.214)
 - V** CWE-98: Improper Control of Filename for Include/Require Statement in PHP Program ('PHP Remote File Inclusion') (p.223)
- C** CWE-715: OWASP Top Ten 2007 Category A4 - Insecure Direct Object Reference (p.1773)
 - B** CWE-22: Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal') (p.31)
 - B** CWE-472: External Control of Assumed-Immutable Web Parameter (p.1009)
 - B** CWE-639: Authorization Bypass Through User-Controlled Key (p.1262)
- C** CWE-716: OWASP Top Ten 2007 Category A5 - Cross Site Request Forgery (CSRF) (p.1774)
 - B** CWE-352: Cross-Site Request Forgery (CSRF) (p.782)
- C** CWE-717: OWASP Top Ten 2007 Category A6 - Information Leakage and Improper Error Handling (p.1774)
 - G** CWE-200: Information Exposure (p.475)
 - B** CWE-203: Information Exposure Through Discrepancy (p.485)
 - B** CWE-209: Information Exposure Through an Error Message (p.497)
 - V** CWE-215: Information Exposure Through Debug Information (p.513)
- C** CWE-718: OWASP Top Ten 2007 Category A7 - Broken Authentication and Session Management (p.1775)
 - G** CWE-287: Improper Authentication (p.637)
 - V** CWE-301: Reflection Attack in an Authentication Protocol (p.673)
 - B** CWE-522: Insufficiently Protected Credentials (p.1098)
- C** CWE-719: OWASP Top Ten 2007 Category A8 - Insecure Cryptographic Storage (p.1775)
 - G** CWE-311: Missing Encryption of Sensitive Data (p.693)
 - B** CWE-321: Use of Hard-coded Cryptographic Key (p.716)
 - B** CWE-325: Missing Required Cryptographic Step (p.723)
 - G** CWE-326: Inadequate Encryption Strength (p.725)
- C** CWE-720: OWASP Top Ten 2007 Category A9 - Insecure Communications (p.1775)
 - G** CWE-311: Missing Encryption of Sensitive Data (p.693)
 - B** CWE-321: Use of Hard-coded Cryptographic Key (p.716)
 - B** CWE-325: Missing Required Cryptographic Step (p.723)
 - G** CWE-326: Inadequate Encryption Strength (p.725)
- C** CWE-721: OWASP Top Ten 2007 Category A10 - Failure to Restrict URL Access (p.1776)
 - G** CWE-285: Improper Authorization (p.629)
 - B** CWE-288: Authentication Bypass Using an Alternate Path or Channel (p.643)
 - B** CWE-425: Direct Request ('Forced Browsing') (p.923)

Graph View: **CWE-631: DEPRECATED: Resource-specific Weaknesses**

Graph View: CWE-699: Development Concepts

- CWE-16: Configuration (*p. 1748*)
 - CWE-4: J2EE Environment Issues (*p. 1748*)
 - ▼ CWE-5: J2EE Misconfiguration: Data Transmission Without Encryption (*p. 1*)
 - ▼ CWE-555: J2EE Misconfiguration: Plaintext Password in Configuration File (*p. 1137*)
 - ▼ CWE-6: J2EE Misconfiguration: Insufficient Session-ID Length (*p. 2*)
 - ▼ CWE-7: J2EE Misconfiguration: Missing Custom Error Page (*p. 4*)
 - ▼ CWE-8: J2EE Misconfiguration: Entity Bean Declared Remote (*p. 6*)
 - ▼ CWE-9: J2EE Misconfiguration: Weak Access Permissions for EJB Methods (*p. 7*)
 - CWE-519: .NET Environment Issues (*p. 1771*)
 - ▼ CWE-11: ASP.NET Misconfiguration: Creating Debug Binary (*p. 9*)
 - ▼ CWE-12: ASP.NET Misconfiguration: Missing Custom Error Page (*p. 10*)
 - ▼ CWE-13: ASP.NET Misconfiguration: Password in Configuration File (*p. 12*)
 - ▼ CWE-520: .NET Misconfiguration: Use of Impersonation (*p. 1095*)
 - ▼ CWE-554: ASP.NET Misconfiguration: Not Using Input Validation Framework (*p. 1136*)
 - ▼ CWE-556: ASP.NET Misconfiguration: Use of Identity Impersonation (*p. 1138*)
- CWE-19: Data Processing Errors (*p. 1749*)
 - CWE-116: Improper Encoding or Escaping of Output (*p. 265*)
 - CWE-117: Improper Output Neutralization for Logs (*p. 272*)
 - ▼ CWE-644: Improper Neutralization of HTTP Headers for Scripting Syntax (*p. 1276*)
 - CWE-74: Improper Neutralization of Special Elements in Output Used by a Downstream Component ('Injection') (*p. 133*)
 - CWE-138: Improper Neutralization of Special Elements (*p. 348*)
 - CWE-140: Improper Neutralization of Delimiters (*p. 351*)
 - ▼ CWE-141: Improper Neutralization of Parameter/Argument Delimiters (*p. 353*)
 - ▼ CWE-142: Improper Neutralization of Value Delimiters (*p. 355*)
 - ▼ CWE-143: Improper Neutralization of Record Delimiters (*p. 356*)
 - ▼ CWE-144: Improper Neutralization of Line Delimiters (*p. 358*)
 - ▼ CWE-145: Improper Neutralization of Section Delimiters (*p. 360*)
 - ▼ CWE-146: Improper Neutralization of Expression/Command Delimiters (*p. 362*)
 - ▼ CWE-147: Improper Neutralization of Input Terminators (*p. 364*)
 - ▼ CWE-148: Improper Neutralization of Input Leaders (*p. 366*)
 - ▼ CWE-149: Improper Neutralization of Quoting Syntax (*p. 367*)
 - ▼ CWE-150: Improper Neutralization of Escape, Meta, or Control Sequences (*p. 369*)
 - ▼ CWE-151: Improper Neutralization of Comment Delimiters (*p. 372*)
 - ▼ CWE-152: Improper Neutralization of Macro Symbols (*p. 374*)
 - ▼ CWE-153: Improper Neutralization of Substitution Characters (*p. 375*)
 - ▼ CWE-154: Improper Neutralization of Variable Name Delimiters (*p. 377*)
 - ▼ CWE-155: Improper Neutralization of Wildcards or Matching Symbols (*p. 379*)
 - ▼ CWE-156: Improper Neutralization of Whitespace (*p. 381*)
 - ▼ CWE-157: Failure to Sanitize Paired Delimiters (*p. 383*)
 - ▼ CWE-158: Improper Neutralization of Null Byte or NUL Character (*p. 385*)
 - CWE-159: Failure to Sanitize Special Element (*p. 387*)
 - CWE-166: Improper Handling of Missing Special Element (*p. 399*)
 - CWE-167: Improper Handling of Additional Special Element (*p. 401*)
 - CWE-168: Improper Handling of Inconsistent Special Elements (*p. 403*)
 - ▼ CWE-160: Improper Neutralization of Leading Special Elements (*p. 389*)
 - ▼ CWE-161: Improper Neutralization of Multiple Leading Special Elements (*p. 391*)
 - ▼ CWE-162: Improper Neutralization of Trailing Special Elements (*p. 393*)
 - ▼ CWE-163: Improper Neutralization of Multiple Trailing Special Elements (*p. 394*)
 - ▼ CWE-164: Improper Neutralization of Internal Special Elements (*p. 396*)
 - ▼ CWE-165: Improper Neutralization of Multiple Internal Special Elements (*p. 398*)
 - CWE-170: Improper Null Termination (*p. 404*)
 - CWE-790: Improper Filtering of Special Elements (*p. 1491*)
 - CWE-791: Incomplete Filtering of Special Elements (*p. 1493*)

- V CWE-792: Incomplete Filtering of One or More Instances of Special Elements (p.1494)
- V CWE-793: Only Filtering One Instance of a Special Element (p.1495)
- V CWE-794: Incomplete Filtering of Multiple Instances of Special Elements (p.1497)
- B CWE-795: Only Filtering Special Elements at a Specified Location (p.1498)
- V CWE-796: Only Filtering Special Elements Relative to a Marker (p.1499)
- V CWE-797: Only Filtering Special Elements at an Absolute Position (p.1501)
- C CWE-75: Failure to Sanitize Special Elements into a Different Plane (Special Element Injection) (p.137)
- B CWE-76: Improper Neutralization of Equivalent Special Elements (p.138)
- C CWE-77: Improper Neutralization of Special Elements used in a Command ('Command Injection') (p.139)
 - B CWE-624: Executable Regular Expression Error (p.1246)
 - B CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p.144)
 - B CWE-88: Improper Delimitation of Arguments in a Command ('Argument Injection') (p.186)
 - B CWE-917: Improper Neutralization of Special Elements used in an Expression Language Statement ('Expression Language Injection') (p.1614)
- B CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') (p.156)
 - V CWE-80: Improper Neutralization of Script-Related HTML Tags in a Web Page (Basic XSS) (p.169)
 - V CWE-81: Improper Neutralization of Script in an Error Message Web Page (p.171)
 - V CWE-83: Improper Neutralization of Script in Attributes in a Web Page (p.175)
 - V CWE-82: Improper Neutralization of Script in Attributes of IMG Tags in a Web Page (p.174)
 - V CWE-84: Improper Neutralization of Encoded URI Schemes in a Web Page (p.178)
 - V CWE-85: Doubled Character XSS Manipulations (p.180)
 - V CWE-86: Improper Neutralization of Invalid Characters in Identifiers in Web Pages (p.182)
 - V CWE-87: Improper Neutralization of Alternate XSS Syntax (p.184)
- B CWE-91: XML Injection (aka Blind XPath Injection) (p.204)
 - B CWE-643: Improper Neutralization of Data within XPath Expressions ('XPath Injection') (p.1274)
 - B CWE-652: Improper Neutralization of Data within XQuery Expressions ('XQuery Injection') (p.1289)
- B CWE-93: Improper Neutralization of CRLF Sequences ('CRLF Injection') (p.207)
- B CWE-94: Improper Control of Generation of Code ('Code Injection') (p.209)
 - V CWE-95: Improper Neutralization of Directives in Dynamically Evaluated Code ('Eval Injection') (p.214)
 - B CWE-96: Improper Neutralization of Directives in Statically Saved Code ('Static Code Injection') (p.218)
 - V CWE-97: Improper Neutralization of Server-Side Includes (SSI) Within a Web Page (p.222)
- C CWE-943: Improper Neutralization of Special Elements in Data Query Logic (p.1641)
 - B CWE-643: Improper Neutralization of Data within XPath Expressions ('XPath Injection') (p.1274)
 - B CWE-652: Improper Neutralization of Data within XQuery Expressions ('XQuery Injection') (p.1289)
 - B CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') (p.191)
 - V CWE-564: SQL Injection: Hibernate (p.1147)
 - B CWE-90: Improper Neutralization of Special Elements used in an LDAP Query ('LDAP Injection') (p.202)
- B CWE-99: Improper Control of Resource Identifiers ('Resource Injection') (p.230)
 - B CWE-641: Improper Restriction of Names for Files and Other Resources (p.1266)

- B CWE-694: Use of Multiple Resources with Duplicate Identifier (p.1359)
- B CWE-914: Improper Control of Dynamically-Identified Variables (p.1605)
 - B CWE-621: Variable Extraction Error (p.1241)
 - B CWE-627: Dynamic Variable Evaluation (p.1251)
- B CWE-838: Inappropriate Encoding for Output Context (p.1567)
- C CWE-119: Improper Restriction of Operations within the Bounds of a Memory Buffer (p.276)
 - B CWE-120: Buffer Copy without Checking Size of Input ('Classic Buffer Overflow') (p.286)
 - V CWE-785: Use of Path Manipulation Function without Maximum-sized Buffer (p.1473)
 - B CWE-125: Out-of-bounds Read (p.307)
 - V CWE-126: Buffer Over-read (p.311)
 - V CWE-127: Buffer Under-read (p.314)
 - B CWE-130: Improper Handling of Length Parameter Inconsistency (p.327)
 - B CWE-786: Access of Memory Location Before Start of Buffer (p.1475)
 - B CWE-124: Buffer Underwrite ('Buffer Underflow') (p.304)
 - V CWE-127: Buffer Under-read (p.314)
 - B CWE-787: Out-of-bounds Write (p.1478)
 - V CWE-121: Stack-based Buffer Overflow (p.295)
 - V CWE-122: Heap-based Buffer Overflow (p.298)
 - B CWE-123: Write-what-where Condition (p.301)
 - B CWE-124: Buffer Underwrite ('Buffer Underflow') (p.304)
 - B CWE-788: Access of Memory Location After End of Buffer (p.1484)
 - V CWE-121: Stack-based Buffer Overflow (p.295)
 - V CWE-122: Heap-based Buffer Overflow (p.298)
 - V CWE-126: Buffer Over-read (p.311)
 - B CWE-805: Buffer Access with Incorrect Length Value (p.1513)
 - V CWE-806: Buffer Access Using Size of Source Buffer (p.1519)
 - B CWE-822: Untrusted Pointer Dereference (p.1531)
 - B CWE-823: Use of Out-of-range Pointer Offset (p.1533)
 - B CWE-824: Access of Uninitialized Pointer (p.1536)
 - B CWE-825: Expired Pointer Dereference (p.1538)
- C CWE-133: String Errors (p.1750)
 - B CWE-134: Use of Externally-Controlled Format String (p.340)
 - B CWE-135: Incorrect Calculation of Multi-Byte String Length (p.345)
 - C CWE-251: Often Misused: String Management (p.1753)
 - V CWE-597: Use of Wrong Operator in String Comparison (p.1199)
- C CWE-136: Type Errors (p.1750)
 - B CWE-681: Incorrect Conversion between Numeric Types (p.1334)
 - V CWE-194: Unexpected Sign Extension (p.463)
 - V CWE-195: Signed to Unsigned Conversion Error (p.466)
 - V CWE-196: Unsigned to Signed Conversion Error (p.469)
 - B CWE-197: Numeric Truncation Error (p.471)
 - C CWE-704: Incorrect Type Conversion or Cast (p.1370)
 - B CWE-843: Access of Resource Using Incompatible Type ('Type Confusion') (p.1579)
- C CWE-137: Representation Errors (p.1750)
 - C CWE-138: Improper Neutralization of Special Elements (p.348)
 - B CWE-140: Improper Neutralization of Delimiters (p.351)
 - V CWE-141: Improper Neutralization of Parameter/Argument Delimiters (p.353)
 - V CWE-142: Improper Neutralization of Value Delimiters (p.355)
 - V CWE-143: Improper Neutralization of Record Delimiters (p.356)
 - V CWE-144: Improper Neutralization of Line Delimiters (p.358)
 - V CWE-145: Improper Neutralization of Section Delimiters (p.360)
 - V CWE-146: Improper Neutralization of Expression/Command Delimiters (p.362)
 - V CWE-147: Improper Neutralization of Input Terminators (p.364)
 - V CWE-148: Improper Neutralization of Input Leaders (p.366)
 - V CWE-149: Improper Neutralization of Quoting Syntax (p.367)

- V CWE-150: Improper Neutralization of Escape, Meta, or Control Sequences (p.369)
- V CWE-151: Improper Neutralization of Comment Delimiters (p.372)
- V CWE-152: Improper Neutralization of Macro Symbols (p.374)
- V CWE-153: Improper Neutralization of Substitution Characters (p.375)
- V CWE-154: Improper Neutralization of Variable Name Delimiters (p.377)
- V CWE-155: Improper Neutralization of Wildcards or Matching Symbols (p.379)
- V CWE-156: Improper Neutralization of Whitespace (p.381)
- V CWE-157: Failure to Sanitize Paired Delimiters (p.383)
- V CWE-158: Improper Neutralization of Null Byte or NUL Character (p.385)
- G CWE-159: Failure to Sanitize Special Element (p.387)
 - E CWE-166: Improper Handling of Missing Special Element (p.399)
 - E CWE-167: Improper Handling of Additional Special Element (p.401)
 - E CWE-168: Improper Handling of Inconsistent Special Elements (p.403)
- V CWE-160: Improper Neutralization of Leading Special Elements (p.389)
 - V CWE-161: Improper Neutralization of Multiple Leading Special Elements (p.391)
- V CWE-162: Improper Neutralization of Trailing Special Elements (p.393)
 - V CWE-163: Improper Neutralization of Multiple Trailing Special Elements (p.394)
- V CWE-164: Improper Neutralization of Internal Special Elements (p.396)
 - V CWE-165: Improper Neutralization of Multiple Internal Special Elements (p.398)
- E CWE-170: Improper Null Termination (p.404)
- G CWE-790: Improper Filtering of Special Elements (p.1491)
 - E CWE-791: Incomplete Filtering of Special Elements (p.1493)
 - V CWE-792: Incomplete Filtering of One or More Instances of Special Elements (p.1494)
 - V CWE-793: Only Filtering One Instance of a Special Element (p.1495)
 - V CWE-794: Incomplete Filtering of Multiple Instances of Special Elements (p.1497)
 - E CWE-795: Only Filtering Special Elements at a Specified Location (p.1498)
 - V CWE-796: Only Filtering Special Elements Relative to a Marker (p.1499)
 - V CWE-797: Only Filtering Special Elements at an Absolute Position (p.1501)
- C CWE-171: Cleansing, Canonicalization, and Comparison Errors (p.1751)
 - G CWE-172: Encoding Error (p.408)
 - V CWE-173: Improper Handling of Alternate Encoding (p.411)
 - V CWE-174: Double Decoding of the Same Data (p.412)
 - V CWE-175: Improper Handling of Mixed Encoding (p.415)
 - V CWE-176: Improper Handling of Unicode Encoding (p.416)
 - V CWE-177: Improper Handling of URL Encoding (Hex Encoding) (p.418)
 - E CWE-178: Improper Handling of Case Sensitivity (p.421)
 - E CWE-179: Incorrect Behavior Order: Early Validation (p.424)
 - E CWE-180: Incorrect Behavior Order: Validate Before Canonicalize (p.427)
 - E CWE-181: Incorrect Behavior Order: Validate Before Filter (p.429)
 - E CWE-182: Collapse of Data into Unsafe Value (p.431)
 - E CWE-183: Permissive Whitelist (p.433)
 - E CWE-184: Incomplete Blacklist (p.435)
 - E CWE-185: Incorrect Regular Expression (p.437)
 - E CWE-186: Overly Restrictive Regular Expression (p.440)
 - E CWE-625: Permissive Regular Expression (p.1248)
 - V CWE-777: Regular Expression without Anchors (p.1457)
 - V CWE-187: Partial String Comparison (p.441)
 - V CWE-478: Missing Default Case in Switch Statement (p.1025)
 - V CWE-486: Comparison of Classes by Name (p.1043)
 - V CWE-595: Comparison of Object References Instead of Object Contents (p.1197)
 - V CWE-597: Use of Wrong Operator in String Comparison (p.1199)
 - G CWE-697: Incorrect Comparison (p.1362)
 - E CWE-1023: Incomplete Comparison with Missing Factors (p.1652)
 - E CWE-1024: Comparison of Incompatible Types (p.1654)

- B CWE-1025: Comparison Using Wrong Factors (p.1655)
- G CWE-707: Improper Enforcement of Message or Data Structure (p.1375)
- V CWE-768: Incorrect Short Circuit Evaluation (p.1434)
- B CWE-188: Reliance on Data/Memory Layout (p.444)

 - B CWE-304: Missing Critical Step in Authentication (p.678)
 - B CWE-305: Authentication Bypass by Primary Weakness (p.679)
 - B CWE-306: Missing Authentication for Critical Function (p.681)
 - B CWE-307: Improper Restriction of Excessive Authentication Attempts (p.685)
 - B CWE-308: Use of Single-factor Authentication (p.689)
 - B CWE-309: Use of Password System for Primary Authentication (p.691)
 - V CWE-593: Authentication Bypass: OpenSSL CTX Object Modified after SSL Objects are Created (p.1193)
 - B CWE-603: Use of Client-Side Authentication (p.1214)
 - V CWE-620: Unverified Password Change (p.1239)
 - B CWE-645: Overly Restrictive Account Lockout Mechanism (p.1277)
 - B CWE-804: Guessable CAPTCHA (p.1511)
 - B CWE-836: Use of Password Hash Instead of Password for Authentication (p.1565)
- B CWE-346: Origin Validation Error (p.769)
- V CWE-782: Exposed IOCTL with Insufficient Access Control (p.1466)
- G CWE-923: Improper Restriction of Communication Channel to Intended Endpoints (p.1621)
 - G CWE-300: Channel Accessible by Non-Endpoint ('Man-in-the-Middle') (p.670)
 - V CWE-925: Improper Verification of Intent by Broadcast Receiver (p.1623)
 - B CWE-940: Improper Verification of Source of a Communication Channel (p.1634)
 - B CWE-941: Incorrectly Specified Destination in a Communication Channel (p.1636)
- V CWE-942: Overly Permissive Cross-domain Whitelist (p.1638)
- B CWE-749: Exposed Dangerous Method or Function (p.1390)
- V CWE-782: Exposed IOCTL with Insufficient Access Control (p.1466)
- C CWE-310: Cryptographic Issues (p.1757)
 - B CWE-295: Improper Certificate Validation (p.655)
 - B CWE-296: Improper Following of a Certificate's Chain of Trust (p.660)

- V CWE-297: Improper Validation of Certificate with Host Mismatch (p.663)
- V CWE-298: Improper Validation of Certificate Expiration (p.666)
- B CWE-299: Improper Check for Certificate Revocation (p.668)
 - V CWE-370: Missing Check for Certificate Revocation after Initial Check (p.829)
- V CWE-599: Missing Validation of OpenSSL Certificate (p.1202)
- G CWE-311: Missing Encryption of Sensitive Data (p.693)
- B CWE-312: Cleartext Storage of Sensitive Information (p.700)
 - V CWE-313: Cleartext Storage in a File or on Disk (p.704)
 - V CWE-314: Cleartext Storage in the Registry (p.706)
 - V CWE-315: Cleartext Storage of Sensitive Information in a Cookie (p.707)
 - V CWE-316: Cleartext Storage of Sensitive Information in Memory (p.709)
 - V CWE-317: Cleartext Storage of Sensitive Information in GUI (p.710)
 - V CWE-318: Cleartext Storage of Sensitive Information in Executable (p.712)
- B CWE-319: Cleartext Transmission of Sensitive Information (p.713)
- V CWE-614: Sensitive Cookie in HTTPS Session Without 'Secure' Attribute (p.1230)
- C CWE-320: Key Management Errors (p.1758)
 - B CWE-321: Use of Hard-coded Cryptographic Key (p.716)
 - B CWE-322: Key Exchange without Entity Authentication (p.718)
 - V CWE-323: Reusing a Nonce, Key Pair in Encryption (p.720)
 - B CWE-324: Use of a Key Past its Expiration Date (p.722)
- B CWE-325: Missing Required Cryptographic Step (p.723)
- G CWE-326: Inadequate Encryption Strength (p.725)
 - V CWE-261: Weak Cryptography for Passwords (p.582)
- G CWE-327: Use of a Broken or Risky Cryptographic Algorithm (p.727)
 - B CWE-916: Use of Password Hash With Insufficient Computational Effort (p.1610)
 - V CWE-759: Use of a One-Way Hash without a Salt (p.1408)
 - V CWE-760: Use of a One-Way Hash with a Predictable Salt (p.1413)
- B CWE-328: Reversible One-Way Hash (p.733)
- V CWE-329: Not Using a Random IV with CBC Mode (p.736)
- B CWE-347: Improper Verification of Cryptographic Signature (p.772)
- V CWE-780: Use of RSA Algorithm without OAEP (p.1462)
- G CWE-330: Use of Insufficiently Random Values (p.738)
 - B CWE-331: Insufficient Entropy (p.744)
 - V CWE-332: Insufficient Entropy in PRNG (p.746)
 - V CWE-333: Improper Handling of Insufficient Entropy in TRNG (p.748)
 - B CWE-334: Small Space of Random Values (p.749)
 - B CWE-335: Incorrect Usage of Seeds in Pseudo-Random Number Generator (PRNG) (p.752)
 - V CWE-336: Same Seed in Pseudo-Random Number Generator (PRNG) (p.753)
 - V CWE-337: Predictable Seed in Pseudo-Random Number Generator (PRNG) (p.755)
 - V CWE-339: Small Seed Space in PRNG (p.758)
 - B CWE-338: Use of Cryptographically Weak Pseudo-Random Number Generator (PRNG) (p.756)
- G CWE-340: Predictability Problems (p.760)
- B CWE-341: Predictable from Observable State (p.761)
- B CWE-342: Predictable Exact Value from Previous Values (p.763)
- B CWE-343: Predictable Value Range from Previous Values (p.764)
- B CWE-344: Use of Invariant Value in Dynamically Changing Context (p.765)
- B CWE-804: Guessable CAPTCHA (p.1511)
- G CWE-345: Insufficient Verification of Data Authenticity (p.767)
 - B CWE-346: Origin Validation Error (p.769)
 - B CWE-347: Improper Verification of Cryptographic Signature (p.772)
 - B CWE-348: Use of Less Trusted Source (p.774)
 - B CWE-349: Acceptance of Extraneous Untrusted Data With Trusted Data (p.776)
 - B CWE-351: Insufficient Type Distinction (p.781)
 - B CWE-352: Cross-Site Request Forgery (CSRF) (p.782)
 - B CWE-353: Missing Support for Integrity Check (p.788)

- B CWE-354: Improper Validation of Integrity Check Value (p.790)
- B CWE-360: Trust of System Event Data (p.800)
- V CWE-646: Reliance on File Name or Extension of Externally-Supplied File (p.1279)
- B CWE-649: Reliance on Obfuscation or Encryption of Security-Relevant Inputs without Integrity Checking (p.1284)
- B CWE-924: Improper Enforcement of Message Integrity During Transmission in a Communication Channel (p.1622)
- B CWE-358: Improperly Implemented Security Check for Standard (p.795)
- G CWE-359: Exposure of Private Information ('Privacy Violation') (p.796)
- B CWE-565: Reliance on Cookies without Validation and Integrity Checking (p.1149)
- V CWE-784: Reliance on Cookies without Validation and Integrity Checking in a Security Decision (p.1471)
- B CWE-602: Client-Side Enforcement of Server-Side Security (p.1210)
- B CWE-653: Insufficient Compartmentalization (p.1290)
- B CWE-654: Reliance on a Single Factor in a Security Decision (p.1293)
- B CWE-655: Insufficient Psychological Acceptability (p.1295)
- B CWE-656: Reliance on Security Through Obscurity (p.1296)
- G CWE-693: Protection Mechanism Failure (p.1357)
- B CWE-757: Selection of Less-Secure Algorithm During Negotiation ('Algorithm Downgrade') (p.1405)
- B CWE-778: Insufficient Logging (p.1458)
- B CWE-779: Logging of Excessive Data (p.1461)
- B CWE-807: Reliance on Untrusted Inputs in a Security Decision (p.1523)
- C CWE-361: 7PK - Time and State (p.1759)
- G CWE-362: Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition') (p.801)
 - B CWE-364: Signal Handler Race Condition (p.810)
 - B CWE-432: Dangerous Signal Handler not Disabled During Sensitive Operations (p.941)
 - B CWE-828: Signal Handler with Functionality that is not Asynchronous-Safe (p.1544)
 - V CWE-479: Signal Handler Use of a Non-reentrant Function (p.1028)
 - B CWE-831: Signal Handler Function Associated with Multiple Signals (p.1555)
 - B CWE-366: Race Condition within a Thread (p.817)
 - B CWE-367: Time-of-check Time-of-use (TOCTOU) Race Condition (p.820)
 - B CWE-363: Race Condition Enabling Link Following (p.809)
 - B CWE-365: Race Condition in Switch (p.815)
 - B CWE-368: Context Switching Race Condition (p.824)
 - B CWE-421: Race Condition During Access to Alternate Channel (p.919)
- C CWE-371: State Issues (p.1760)
 - B CWE-372: Incomplete Internal State Distinction (p.831)
 - B CWE-374: Passing Mutable Objects to an Untrusted Method (p.832)
 - B CWE-375: Returning a Mutable Object to an Untrusted Caller (p.835)
 - V CWE-585: Empty Synchronized Block (p.1182)
 - G CWE-642: External Control of Critical State Data (p.1268)
 - B CWE-15: External Control of System or Configuration Setting (p.16)
- C CWE-376: Temporary File Issues (p.1761)
 - B CWE-377: Insecure Temporary File (p.837)
 - B CWE-378: Creation of Temporary File With Insecure Permissions (p.839)
 - V CWE-379: Creation of Temporary File in Directory with Incorrect Permissions (p.841)
- C CWE-380: Technology-Specific Time and State Issues (p.1761)
 - C CWE-381: J2EE Time and State Issues (p.1761)
 - V CWE-382: J2EE Bad Practices: Use of System.exit() (p.844)
 - V CWE-383: J2EE Bad Practices: Direct Use of Threads (p.845)
 - V CWE-543: Use of Singleton Pattern Without Synchronization in a Multithreaded Context (p.1123)
- B CWE-384: Session Fixation (p.847)
- B CWE-385: Covert Timing Channel (p.850)

- B CWE-386: Symbolic Name not Mapping to Correct Object (p.852)
- C CWE-387: Signal Errors (p.1762)
 - B CWE-364: Signal Handler Race Condition (p.810)
 - B CWE-432: Dangerous Signal Handler not Disabled During Sensitive Operations (p.941)
 - B CWE-828: Signal Handler with Functionality that is not Asynchronous-Safe (p.1544)
 - V CWE-479: Signal Handler Use of a Non-reentrant Function (p.1028)
 - B CWE-831: Signal Handler Function Associated with Multiple Signals (p.1555)
- B CWE-412: Unrestricted Externally Accessible Lock (p.901)
- C CWE-557: Concurrency Issues (p.1771)
 - B CWE-366: Race Condition within a Thread (p.817)
 - V CWE-558: Use of getlogin() in Multithreaded Application (p.1138)
 - B CWE-567: Unsynchronized Access to Shared Data in a Multithreaded Context (p.1152)
 - V CWE-572: Call to Thread run() instead of start() (p.1160)
- B CWE-609: Double-Checked Locking (p.1221)
- B CWE-613: Insufficient Session Expiration (p.1228)
- G CWE-662: Improper Synchronization (p.1300)
 - B CWE-1058: Invokable Control Element in Multi-Thread Context with non-Final Static Storable or Member Element (p.1678)
 - B CWE-667: Improper Locking (p.1311)
 - V CWE-764: Multiple Locks of a Critical Resource (p.1427)
 - B CWE-765: Multiple Unlocks of a Critical Resource (p.1428)
 - B CWE-832: Unlock of a Resource that is not Locked (p.1557)
 - B CWE-833: Deadlock (p.1558)
 - B CWE-820: Missing Synchronization (p.1528)
 - V CWE-1096: Singleton Class Instance Creation without Proper Locking or Synchronization (p.1714)
 - V CWE-543: Use of Singleton Pattern Without Synchronization in a Multithreaded Context (p.1123)
 - B CWE-821: Incorrect Synchronization (p.1530)
 - B CWE-1088: Synchronous Access of Remote Resource without Timeout (p.1706)
 - V CWE-572: Call to Thread run() instead of start() (p.1160)
 - V CWE-574: EJB Bad Practices: Use of Synchronization Primitives (p.1164)
- B CWE-663: Use of a Non-reentrant Function in a Concurrent Context (p.1301)
 - V CWE-479: Signal Handler Use of a Non-reentrant Function (p.1028)
- G CWE-664: Improper Control of a Resource Through its Lifetime (p.1303)
 - C CWE-704: Incorrect Type Conversion or Cast (p.1370)
 - B CWE-843: Access of Resource Using Incompatible Type ('Type Confusion') (p.1579)
 - C CWE-706: Use of Incorrectly-Resolved Name or Reference (p.1373)
 - C CWE-922: Insecure Storage of Sensitive Information (p.1619)
 - B CWE-312: Cleartext Storage of Sensitive Information (p.700)
 - V CWE-313: Cleartext Storage in a File or on Disk (p.704)
 - V CWE-314: Cleartext Storage in the Registry (p.706)
 - V CWE-315: Cleartext Storage of Sensitive Information in a Cookie (p.707)
 - V CWE-316: Cleartext Storage of Sensitive Information in Memory (p.709)
 - V CWE-317: Cleartext Storage of Sensitive Information in GUI (p.710)
 - V CWE-318: Cleartext Storage of Sensitive Information in Executable (p.712)
 - B CWE-921: Storage of Sensitive Data in a Mechanism without Access Control (p.1618)
- G CWE-668: Exposure of Resource to Wrong Sphere (p.1316)
 - B CWE-134: Use of Externally-Controlled Format String (p.340)
 - B CWE-552: Files or Directories Accessible to External Parties (p.1133)
 - V CWE-527: Exposure of CVS Repository to an Unauthorized Control Sphere (p.1106)
 - V CWE-528: Exposure of Core Dump File to an Unauthorized Control Sphere (p.1107)
 - V CWE-529: Exposure of Access Control List Files to an Unauthorized Control Sphere (p.1108)
 - V CWE-532: Inclusion of Sensitive Information in Log Files (p.1111)
 - V CWE-540: Information Exposure Through Source Code (p.1121)

- B CWE-1050: Excessive Platform Resource Consumption within a Loop (p.1670)
- B CWE-1072: Data Resource Access without Use of Connection Pooling (p.1691)
- B CWE-1073: Non-SQL Invokable Control Element with Excessive Number of Data Resource Accesses (p.1692)
- B CWE-1084: Invokable Control Element with Excessive File or Data Access Operations (p.1702)
- B CWE-1089: Large Data Table with Excessive Number of Indices (p.1707)
- B CWE-1094: Excessive Index Range Scan for a Data Resource (p.1712)
- G CWE-1176: Inefficient CPU Computation (p.1743)
- V CWE-1042: Static Member Data Element outside of a Singleton Class Element (p.1661)
- B CWE-1046: Creation of Immutable Text Using String Concatenation (p.1666)
- B CWE-1049: Excessive Data Query Operations in a Large Data Table (p.1669)
- B CWE-1063: Creation of Class Instance within a Static Code Block (p.1683)
- B CWE-1067: Excessive Execution of Sequential Searches of Data Resource (p.1687)
- G CWE-406: Insufficient Control of Network Message Volume (Network Amplification) (p.892)
- G CWE-407: Inefficient Algorithmic Complexity (p.894)
- B CWE-408: Incorrect Behavior Order: Early Amplification (p.896)
- B CWE-409: Improper Handling of Highly Compressed Data (Data Amplification) (p.898)
- B CWE-776: Improper Restriction of Recursive Entity References in DTDs ('XML Entity Expansion') (p.1454)
- B CWE-410: Insufficient Resource Pool (p.899)
- C CWE-411: Resource Locking Problems (p.1765)
- B CWE-412: Unrestricted Externally Accessible Lock (p.901)
- B CWE-413: Improper Resource Locking (p.904)
- V CWE-591: Sensitive Data Storage in Improperly Locked Memory (p.1192)
- B CWE-414: Missing Lock Check (p.908)
- V CWE-415: Double Free (p.909)
- V CWE-416: Use After Free (p.912)
- V CWE-568: finalize() Method Without super.finalize() (p.1155)
- V CWE-590: Free of Memory not on the Heap (p.1189)
- V CWE-761: Free of Pointer not at Start of Buffer (p.1416)
- V CWE-762: Mismatched Memory Management Routines (p.1419)
- B CWE-763: Release of Invalid Pointer or Reference (p.1422)
- G CWE-913: Improper Control of Dynamically-Managed Code Resources (p.1603)
- B CWE-502: Deserialization of Untrusted Data (p.1079)
- B CWE-914: Improper Control of Dynamically-Identified Variables (p.1605)
- B CWE-621: Variable Extraction Error (p.1241)
- B CWE-627: Dynamic Variable Evaluation (p.1251)
- B CWE-915: Improperly Controlled Modification of Dynamically-Determined Object Attributes (p.1607)
- C CWE-417: Channel and Path Errors (p.1765)
- B CWE-419: Unprotected Primary Channel (p.916)
- B CWE-420: Unprotected Alternate Channel (p.917)
- B CWE-421: Race Condition During Access to Alternate Channel (p.919)
- V CWE-422: Unprotected Windows Messaging Channel ('Shatter') (p.920)
- G CWE-424: Improper Protection of Alternate Path (p.922)
- B CWE-425: Direct Request ('Forced Browsing') (p.923)
- B CWE-426: Untrusted Search Path (p.926)
- B CWE-427: Uncontrolled Search Path Element (p.931)
- B CWE-428: Unquoted Search Path or Element (p.935)
- G CWE-514: Covert Channel (p.1092)
- B CWE-385: Covert Timing Channel (p.850)
- B CWE-515: Covert Storage Channel (p.1094)
- C CWE-429: Handler Errors (p.1766)
- B CWE-430: Deployment of Wrong Handler (p.938)
- B CWE-431: Missing Handler (p.939)
- B CWE-432: Dangerous Signal Handler not Disabled During Sensitive Operations (p.941)

- V CWE-433: Unparsed Raw Web Content Delivery (p.942)
- B CWE-434: Unrestricted Upload of File with Dangerous Type (p.944)
- V CWE-479: Signal Handler Use of a Non-reentrant Function (p.1028)
- V CWE-616: Incomplete Identification of Uploaded File Variables (PHP) (p.1233)
- C CWE-438: Behavioral Problems (p.1767)
 - G CWE-436: Interpretation Conflict (p.952)
 - B CWE-115: Misinterpretation of Input (p.264)
 - B CWE-437: Incomplete Model of Endpoint Features (p.955)
 - V CWE-626: Null Byte Interaction Error (Poison Null Byte) (p.1250)
 - V CWE-650: Trusting HTTP Permission Methods on the Server Side (p.1286)
 - B CWE-439: Behavioral Change in New Version or Environment (p.956)
 - B CWE-440: Expected Behavior Violation (p.957)
 - G CWE-670: Always-Incorrect Control Flow Implementation (p.1319)
 - G CWE-705: Incorrect Control Flow Scoping (p.1372)
 - G CWE-799: Improper Control of Interaction Frequency (p.1509)
 - B CWE-837: Improper Enforcement of a Single, Unique Action (p.1566)
 - G CWE-834: Excessive Iteration (p.1560)
 - B CWE-835: Loop with Unreachable Exit Condition ('Infinite Loop') (p.1562)
 - B CWE-841: Improper Enforcement of Behavioral Workflow (p.1575)

- B CWE-826: Premature Release of Resource During Expected Lifetime (p.1541)
- G CWE-696: Incorrect Behavior Order (p.1361)
- G CWE-732: Incorrect Permission Assignment for Critical Resource (p.1380)
- G CWE-754: Improper Check for Unusual or Exceptional Conditions (p.1394)
- B CWE-770: Allocation of Resources Without Limits or Throttling (p.1436)
- V CWE-774: Allocation of File Descriptors or Handles Without Limits or Throttling (p.1452)
- V CWE-789: Uncontrolled Memory Allocation (p.1488)
- G CWE-799: Improper Control of Interaction Frequency (p.1509)
- B CWE-837: Improper Enforcement of a Single, Unique Action (p.1566)
- B CWE-841: Improper Enforcement of Behavioral Workflow (p.1575)
- C CWE-442: Web Problems (p.1767)

- V CWE-1004: Sensitive Cookie Without 'HttpOnly' Flag (p.1643)
- B CWE-1007: Insufficient Visual Distinction of Homoglyphs Presented to User (p.1645)
- B CWE-1021: Improper Restriction of Rendered UI Layers or Frames (p.1648)
- V CWE-1022: Use of Web Link to Untrusted Target with window.opener Access (p.1650)
- B CWE-113: Improper Neutralization of CRLF Sequences in HTTP Headers ('HTTP Response Splitting') (p.256)
- B CWE-352: Cross-Site Request Forgery (CSRF) (p.782)
- B CWE-425: Direct Request ('Forced Browsing') (p.923)
- B CWE-444: Inconsistent Interpretation of HTTP Requests ('HTTP Request Smuggling') (p.961)
- B CWE-601: URL Redirection to Untrusted Site ('Open Redirect') (p.1205)
- B CWE-611: Improper Restriction of XML External Entity Reference (p.1225)
- V CWE-614: Sensitive Cookie in HTTPS Session Without 'Secure' Attribute (p.1230)
- V CWE-644: Improper Neutralization of HTTP Headers for Scripting Syntax (p.1276)
- V CWE-646: Reliance on File Name or Extension of Externally-Supplied File (p.1279)
- V CWE-647: Use of Non-Canonical URL Paths for Authorization Decisions (p.1280)
- B CWE-776: Improper Restriction of Recursive Entity References in DTDs ('XML Entity Expansion') (p.1454)
- V CWE-784: Reliance on Cookies without Validation and Integrity Checking in a Security Decision (p.1471)
- B CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') (p.156)
 - V CWE-80: Improper Neutralization of Script-Related HTML Tags in a Web Page (Basic XSS) (p.169)
 - V CWE-81: Improper Neutralization of Script in an Error Message Web Page (p.171)
 - V CWE-83: Improper Neutralization of Script in Attributes in a Web Page (p.175)
 - V CWE-82: Improper Neutralization of Script in Attributes of IMG Tags in a Web Page (p.174)
 - V CWE-84: Improper Neutralization of Encoded URI Schemes in a Web Page (p.178)
 - V CWE-85: Doubled Character XSS Manipulations (p.180)
 - V CWE-86: Improper Neutralization of Invalid Characters in Identifiers in Web Pages (p.182)
 - V CWE-87: Improper Neutralization of Alternate XSS Syntax (p.184)
- V CWE-827: Improper Control of Document Type Definition (p.1542)
- B CWE-918: Server-Side Request Forgery (SSRF) (p.1615)
- C CWE-355: User Interface Security Issues (p.1759)
 - V CWE-317: Cleartext Storage of Sensitive Information in GUI (p.710)
 - B CWE-356: Product UI does not Warn User of Unsafe Actions (p.792)
 - B CWE-357: Insufficient UI Warning of Dangerous Operations (p.794)
 - B CWE-446: UI Discrepancy for Security Feature (p.965)
 - B CWE-447: Unimplemented or Unsupported Feature in UI (p.966)
 - B CWE-448: Obsolete Feature in UI (p.967)
 - B CWE-449: The UI Performs the Wrong Action (p.968)
 - B CWE-450: Multiple Interpretations of UI Input (p.969)
 - G CWE-451: User Interface (UI) Misrepresentation of Critical Information (p.970)
 - B CWE-1007: Insufficient Visual Distinction of Homoglyphs Presented to User (p.1645)
 - B CWE-1021: Improper Restriction of Rendered UI Layers or Frames (p.1648)
 - V CWE-549: Missing Password Field Masking (p.1130)
- C CWE-452: Initialization and Cleanup Errors (p.1768)
 - B CWE-454: External Initialization of Trusted Variables or Data Stores (p.976)
 - B CWE-455: Non-exit on Failed Initialization (p.978)
 - B CWE-459: Incomplete Cleanup (p.987)
 - V CWE-460: Improper Cleanup on Thrown Exception (p.989)
 - G CWE-665: Improper Initialization (p.1305)
 - B CWE-1187: Use of Uninitialized Resource (p.1745)
 - B CWE-457: Use of Uninitialized Variable (p.983)
 - B CWE-1188: Insecure Default Initialization of Resource (p.1746)
 - V CWE-453: Insecure Default Variable Initialization (p.974)
 - B CWE-909: Missing Initialization of Resource (p.1597)
 - V CWE-456: Missing Initialization of a Variable (p.980)

- B CWE-908: Use of Uninitialized Resource (p.1594)
- B CWE-910: Use of Expired File Descriptor (p.1600)
- V CWE-911: Improper Update of Reference Count (p.1601)
- B CWE-1051: Initialization with Hard-Coded Network Resource Configuration Data (p.1671)
- B CWE-1052: Excessive Use of Hard-Coded Literals in Initialization (p.1672)
- C CWE-465: Pointer Issues (p.1769)
 - B CWE-466: Return of Pointer Value Outside of Expected Range (p.997)
 - V CWE-467: Use of sizeof() on a Pointer Type (p.998)
 - B CWE-468: Incorrect Pointer Scaling (p.1001)
 - B CWE-469: Use of Pointer Subtraction to Determine Size (p.1002)
 - B CWE-476: NULL Pointer Dereference (p.1017)
 - B CWE-587: Assignment of a Fixed Address to a Pointer (p.1185)
 - V CWE-588: Attempt to Access Child of a Non-structure Pointer (p.1187)
 - V CWE-761: Free of Pointer not at Start of Buffer (p.1416)
 - B CWE-763: Release of Invalid Pointer or Reference (p.1422)
 - V CWE-781: Improper Address Validation in IOCTL with METHOD_NEITHER I/O Control Code (p.1464)
 - B CWE-822: Untrusted Pointer Dereference (p.1531)
 - B CWE-823: Use of Out-of-range Pointer Offset (p.1533)
 - B CWE-824: Access of Uninitialized Pointer (p.1536)
 - B CWE-825: Expired Pointer Dereference (p.1538)
- C CWE-490: Mobile Code Issues (p.1770)
 - V CWE-491: Public cloneable() Method Without Final ('Object Hijack') (p.1051)
 - V CWE-492: Use of Inner Class Containing Sensitive Data (p.1053)
 - V CWE-493: Critical Public Variable Without Final Modifier (p.1060)
 - V CWE-500: Public Static Field Not Marked Final (p.1075)
 - B CWE-494: Download of Code Without Integrity Check (p.1062)
 - V CWE-495: Private Data Structure Returned From A Public Method (p.1066)
 - V CWE-496: Public Data Assigned to Private Array-Typed Field (p.1068)
 - V CWE-498: Cloneable Class Containing Sensitive Information (p.1072)
 - V CWE-499: Serializable Class Containing Sensitive Data (p.1074)
 - V CWE-582: Array Declared Public, Final, and Static (p.1178)
 - V CWE-583: finalize() Method Declared Public (p.1179)
- C CWE-559: Often Misused: Arguments and Parameters (p.1772)
 - V CWE-560: Use of umask() with chmod-style Argument (p.1140)
 - B CWE-628: Function Call with Incorrectly Specified Arguments (p.1253)
 - V CWE-683: Function Call With Incorrect Order of Arguments (p.1342)
 - V CWE-685: Function Call With Incorrect Number of Arguments (p.1345)
 - V CWE-686: Function Call With Incorrect Argument Type (p.1346)
 - V CWE-687: Function Call With Incorrectly Specified Argument Value (p.1348)
 - V CWE-688: Function Call With Incorrect Variable or Reference as Argument (p.1349)
- C CWE-569: Expression Issues (p.1772)
 - B CWE-480: Use of Incorrect Operator (p.1031)
 - V CWE-481: Assigning instead of Comparing (p.1034)
 - V CWE-482: Comparing instead of Assigning (p.1037)
 - V CWE-597: Use of Wrong Operator in String Comparison (p.1199)
 - V CWE-570: Expression is Always False (p.1156)
 - V CWE-571: Expression is Always True (p.1159)
 - V CWE-588: Attempt to Access Child of a Non-structure Pointer (p.1187)
 - V CWE-595: Comparison of Object References Instead of Object Contents (p.1197)
 - V CWE-597: Use of Wrong Operator in String Comparison (p.1199)
 - B CWE-783: Operator Precedence Logic Error (p.1468)
- G CWE-657: Violation of Secure Design Principles (p.1298)
 - G CWE-250: Execution with Unnecessary Privileges (p.554)

- C CWE-637: Unnecessary Complexity in Protection Mechanism (Not Using 'Economy of Mechanism') (p. 1258)
- C CWE-638: Not Using Complete Mediation (p. 1260)
- B CWE-653: Insufficient Compartmentalization (p. 1290)
- B CWE-654: Reliance on a Single Factor in a Security Decision (p. 1293)
- B CWE-655: Insufficient Psychological Acceptability (p. 1295)
- B CWE-656: Reliance on Security Through Obscurity (p. 1296)
- C CWE-671: Lack of Administrator Control over Security (p. 1321)
- C CWE-1006: Bad Coding Practices (p. 1862)
 - B CWE-475: Undefined Behavior for Input to API (p. 1016)
 - B CWE-477: Use of Obsolete Function (p. 1022)
 - V CWE-483: Incorrect Block Delimitation (p. 1039)
 - B CWE-484: Omitted Break Statement in Switch (p. 1041)
 - V CWE-487: Reliance on Package-level Scope (p. 1046)
 - B CWE-489: Leftover Debug Code (p. 1049)
 - C CWE-573: Improper Following of Specification by Caller (p. 1162)
 - V CWE-577: EJB Bad Practices: Use of Sockets (p. 1170)
 - V CWE-578: EJB Bad Practices: Use of Class Loader (p. 1172)
 - V CWE-579: J2EE Bad Practices: Non-serializable Object Stored in Session (p. 1174)
 - V CWE-580: clone() Method Without super.clone() (p. 1175)
 - B CWE-581: Object Model Violation: Just One of Equals and Hashcode Defined (p. 1176)
 - C CWE-675: Duplicate Operations on Resource (p. 1328)
 - B CWE-694: Use of Multiple Resources with Duplicate Identifier (p. 1359)
 - B CWE-695: Use of Low-Level Functionality (p. 1360)
 - V CWE-245: J2EE Bad Practices: Direct Management of Connections (p. 549)
 - V CWE-246: J2EE Bad Practices: Direct Use of Sockets (p. 551)
 - V CWE-574: EJB Bad Practices: Use of Synchronization Primitives (p. 1164)
 - V CWE-575: EJB Bad Practices: Use of AWT Swing (p. 1165)
 - V CWE-576: EJB Bad Practices: Use of Java I/O (p. 1168)
- V CWE-594: J2EE Framework: Saving Unserializable Objects to Disk (p. 1195)
- B CWE-605: Multiple Binds to the Same Port (p. 1215)
- C CWE-684: Incorrect Provision of Specified Functionality (p. 1344)
- C CWE-758: Reliance on Undefined, Unspecified, or Implementation-Defined Behavior (p. 1406)
 - B CWE-1102: Reliance on Machine-Dependent Data Representation (p. 1720)
 - B CWE-474: Use of Function with Inconsistent Implementations (p. 1014)
 - V CWE-589: Call to Non-ubiquitous API (p. 1188)
 - B CWE-562: Return of Stack Variable Address (p. 1144)
- B CWE-1041: Use of Redundant Code (p. 1660)
- B CWE-1044: Architecture with Number of Horizontal Layers Outside of Expected Range (p. 1663)
- B CWE-1048: Invokable Control Element with Large Number of Outward Calls (p. 1668)
- C CWE-1059: Incomplete Documentation (p. 1678)
 - B CWE-1053: Missing Documentation for Design (p. 1673)
 - B CWE-1110: Incomplete Design Documentation (p. 1726)
 - B CWE-1111: Incomplete I/O Documentation (p. 1727)
 - B CWE-1112: Incomplete Documentation of Program Execution (p. 1727)
 - B CWE-1118: Insufficient Documentation of Error Handling Techniques (p. 1732)
- C CWE-1061: Insufficient Encapsulation (p. 1680)
 - B CWE-1054: Invocation of a Control Element at an Unnecessarily Deep Horizontal Layer (p. 1674)
 - B CWE-1057: Data Access Operations Outside of Expected Data Manager Component (p. 1676)
 - B CWE-1062: Parent Class with References to Child Class (p. 1682)
 - B CWE-1083: Data Access from Outside Expected Data Manager Component (p. 1701)
 - B CWE-1090: Method Containing Access of a Member Element from Another Class (p. 1708)
 - B CWE-1100: Insufficient Isolation of System-Dependent Functions (p. 1718)
 - B CWE-1105: Insufficient Encapsulation of Machine-Dependent Functionality (p. 1722)

- B CWE-1065: Runtime Resource Management Control Element in a Component Built to Run on Application Servers (p.1685)
- B CWE-1066: Missing Serialization Control Element (p.1686)
- B CWE-1068: Inconsistency Between Implementation and Documented Design (p.1687)
- B CWE-1070: Serializable Data Element Containing non-Serializable Item Elements (p.1689)
- G CWE-1076: Insufficient Adherence to Expected Conventions (p.1695)
 - V CWE-1045: Parent Class with a Virtual Destructor and a Child Class without a Virtual Destructor (p.1665)
 - C CWE-1078: Inappropriate Source Code Style or Formatting (p.1697)
 - B CWE-1052: Excessive Use of Hard-Coded Literals in Initialization (p.1672)
 - B CWE-1085: Invokable Control Element with Excessive Volume of Commented-out Code (p.1704)
 - B CWE-1099: Inconsistent Naming Conventions for Identifiers (p.1717)
 - B CWE-1106: Insufficient Use of Symbolic Constants (p.1723)
 - B CWE-1107: Insufficient Isolation of Symbolic Constant Definitions (p.1724)
 - B CWE-1109: Use of Same Variable for Multiple Purposes (p.1725)
 - B CWE-1113: Inappropriate Comment Style (p.1728)
 - B CWE-1114: Inappropriate Whitespace Style (p.1729)
 - B CWE-1115: Source Code Element without Standard Prologue (p.1730)
 - B CWE-1116: Inaccurate Comments (p.1730)
 - B CWE-1117: Callable with Insufficient Behavioral Summary (p.1731)
 - V CWE-546: Suspicious Comment (p.1126)
 - V CWE-547: Use of Hard-coded, Security-relevant Constants (p.1127)
 - B CWE-1079: Parent Class without Virtual Destructor Method (p.1698)
 - B CWE-1082: Class Instance Self Destruction Control Element (p.1700)
 - B CWE-1087: Class with Virtual Method without a Virtual Destructor (p.1706)
 - B CWE-1091: Use of Object without Invoking Destructor Method (p.1709)
 - B CWE-1097: Persistent Storable Data Element without Associated Comparison Control Element (p.1715)
 - V CWE-1098: Data Element containing Pointer Item without Proper Copy Control Element (p.1716)
 - B CWE-1108: Excessive Reliance on Global Variables (p.1725)
 - V CWE-586: Explicit Call to Finalize() (p.1183)
- B CWE-1084: Invokable Control Element with Excessive File or Data Access Operations (p.1702)
- B CWE-1092: Use of Same Invokable Control Element in Multiple Architectural Layers (p.1710)
- G CWE-1093: Excessively Complex Data Representation (p.1711)
 - B CWE-1043: Data Element Aggregating an Excessively Large Number of Non-Primitive Elements (p.1662)
 - B CWE-1055: Multiple Inheritance from Concrete Classes (p.1675)
 - B CWE-1074: Class with Excessively Deep Inheritance (p.1693)
 - B CWE-1086: Class with Excessive Number of Child Classes (p.1705)
- B CWE-1101: Reliance on Runtime Component in Generated Code (p.1719)
- B CWE-1103: Use of Platform-Dependent Third Party Components (p.1721)
- B CWE-1104: Use of Unmaintained Third Party Components (p.1721)
- G CWE-1120: Excessive Code Complexity (p.1734)
 - B CWE-1047: Modules with Circular Dependencies (p.1667)
 - B CWE-1056: Invokable Control Element with Variadic Parameters (p.1675)
 - B CWE-1060: Excessive Number of Inefficient Server-Side Data Accesses (p.1679)
 - B CWE-1064: Invokable Control Element with Signature Containing an Excessive Number of Parameters (p.1684)
 - B CWE-1075: Unconditional Control Flow Transfer outside of Switch Block (p.1694)
 - B CWE-1080: Source Code File with Excessive Number of Lines of Code (p.1699)
 - B CWE-1095: Loop Condition Value Update within the Loop (p.1713)
 - B CWE-1119: Excessive Use of Unconditional Branching (p.1733)
 - B CWE-1121: Excessive McCabe Cyclomatic Complexity (p.1735)
 - B CWE-1122: Excessive Halstead Complexity (p.1736)

- B CWE-1123: Excessive Use of Self-Modifying Code (p.1737)
- B CWE-1124: Excessively Deep Nesting (p.1737)
- B CWE-1125: Excessive Attack Surface (p.1738)
- B CWE-1126: Declaration of Variable with Unnecessarily Wide Scope (p.1739)
- B CWE-1127: Compilation with Insufficient Warnings or Errors (p.1740)
- G CWE-1164: Irrelevant Code (p.1740)
- V CWE-1071: Empty Code Block (p.1690)
 - V CWE-1069: Empty Exception Block (p.1688)
 - V CWE-585: Empty Synchronized Block (p.1182)
- B CWE-561: Dead Code (p.1141)
- V CWE-563: Assignment to Variable without Use (p.1146)
- G CWE-1177: Use of Prohibited Code (p.1744)
- B CWE-676: Use of Potentially Dangerous Function (p.1329)

- CWE-651: Information Exposure Through WSDL File (p.1287)
- C CWE-967: SFP Secondary Cluster: State Disclosure (p.1844)
- CWE-202: Exposure of Sensitive Data Through Data Queries (p.484)
- B CWE-203: Information Exposure Through Discrepancy (p.485)
- B CWE-204: Response Discrepancy Information Exposure (p.489)
- B CWE-205: Information Exposure Through Behavioral Discrepancy (p.492)
- CWE-206: Information Exposure of Internal State Through Behavioral Inconsistency (p.493)
- CWE-207: Information Exposure Through an External Behavioral Inconsistency (p.494)
- B CWE-208: Information Exposure Through Timing Discrepancy (p.495)
- C CWE-896: SFP Primary Cluster: Tainted Input (p.1826)
- C CWE-990: SFP Secondary Cluster: Tainted Input to Command (p.1854)
- CWE-102: Struts: Duplicate Validation Forms (p.233)
- CWE-103: Struts: Incomplete validate() Method Definition (p.235)
- CWE-104: Struts: Form Bean Does Not Extend Validation Class (p.237)
- CWE-105: Struts: Form Field Without Validator (p.239)
- CWE-106: Struts: Plug-in Framework not in Use (p.242)
- CWE-107: Struts: Unused Validation Form (p.245)
- CWE-108: Struts: Unvalidated Action Form (p.247)
- CWE-109: Struts: Validator Turned Off (p.248)
- CWE-110: Struts: Validator Without Form Field (p.250)
- B CWE-112: Missing XML Validation (p.254)
- B CWE-113: Improper Neutralization of CRLF Sequences in HTTP Headers ('HTTP Response Splitting') (p.256)
- B CWE-130: Improper Handling of Length Parameter Inconsistency (p.327)
- B CWE-134: Use of Externally-Controlled Format String (p.340)
- CWE-138: Improper Neutralization of Special Elements (p.348)
- B CWE-140: Improper Neutralization of Delimiters (p.351)
- CWE-141: Improper Neutralization of Parameter/Argument Delimiters (p.353)
- CWE-142: Improper Neutralization of Value Delimiters (p.355)
- CWE-143: Improper Neutralization of Record Delimiters (p.356)
- CWE-144: Improper Neutralization of Line Delimiters (p.358)
- CWE-145: Improper Neutralization of Section Delimiters (p.360)
- CWE-146: Improper Neutralization of Expression/Command Delimiters (p.362)
- CWE-147: Improper Neutralization of Input Terminators (p.364)
- CWE-148: Improper Neutralization of Input Leaders (p.366)
- CWE-149: Improper Neutralization of Quoting Syntax (p.367)
- CWE-150: Improper Neutralization of Escape, Meta, or Control Sequences (p.369)
- CWE-151: Improper Neutralization of Comment Delimiters (p.372)
- CWE-152: Improper Neutralization of Macro Symbols (p.374)
- CWE-153: Improper Neutralization of Substitution Characters (p.375)
- CWE-154: Improper Neutralization of Variable Name Delimiters (p.377)
- CWE-155: Improper Neutralization of Wildcards or Matching Symbols (p.379)
- CWE-156: Improper Neutralization of Whitespace (p.381)
- CWE-157: Failure to Sanitize Paired Delimiters (p.383)
- CWE-158: Improper Neutralization of Null Byte or NUL Character (p.385)
- CWE-159: Failure to Sanitize Special Element (p.387)
- CWE-160: Improper Neutralization of Leading Special Elements (p.389)
- CWE-161: Improper Neutralization of Multiple Leading Special Elements (p.391)
- CWE-162: Improper Neutralization of Trailing Special Elements (p.393)
- CWE-163: Improper Neutralization of Multiple Trailing Special Elements (p.394)
- CWE-164: Improper Neutralization of Internal Special Elements (p.396)
- CWE-165: Improper Neutralization of Multiple Internal Special Elements (p.398)
- B CWE-183: Permissive Whitelist (p.433)

-  CWE-184: Incomplete Blacklist (p.435)
-  CWE-185: Incorrect Regular Expression (p.437)
-  CWE-186: Overly Restrictive Regular Expression (p.440)
-  CWE-444: Inconsistent Interpretation of HTTP Requests ('HTTP Request Smuggling') (p.961)
-  CWE-553: Command Shell in Externally Accessible Directory (p.1135)
-  CWE-554: ASP.NET Misconfiguration: Not Using Input Validation Framework (p.1136)
-  CWE-564: SQL Injection: Hibernate (p.1147)
-  CWE-601: URL Redirection to Untrusted Site ('Open Redirect') (p.1205)
-  CWE-611: Improper Restriction of XML External Entity Reference (p.1225)
-  CWE-619: Dangling Database Cursor ('Cursor Injection') (p.1238)
-  CWE-621: Variable Extraction Error (p.1241)
-  CWE-624: Executable Regular Expression Error (p.1246)
-  CWE-625: Permissive Regular Expression (p.1248)
-  CWE-626: Null Byte Interaction Error (Poison Null Byte) (p.1250)
-  CWE-627: Dynamic Variable Evaluation (p.1251)
-  CWE-641: Improper Restriction of Names for Files and Other Resources (p.1266)
-  CWE-643: Improper Neutralization of Data within XPath Expressions ('XPath Injection') (p.1274)
-  CWE-644: Improper Neutralization of HTTP Headers for Scripting Syntax (p.1276)
-  CWE-646: Reliance on File Name or Extension of Externally-Supplied File (p.1279)
-  CWE-652: Improper Neutralization of Data within XQuery Expressions ('XQuery Injection') (p.1289)
-  CWE-707: Improper Enforcement of Message or Data Structure (p.1375)
-  CWE-74: Improper Neutralization of Special Elements in Output Used by a Downstream Component ('Injection') (p.133)
-  CWE-75: Failure to Sanitize Special Elements into a Different Plane (Special Element Injection) (p.137)
-  CWE-76: Improper Neutralization of Equivalent Special Elements (p.138)
-  CWE-77: Improper Neutralization of Special Elements used in a Command ('Command Injection') (p.139)
-  CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p.144)
-  CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') (p.156)
-  CWE-80: Improper Neutralization of Script-Related HTML Tags in a Web Page (Basic XSS) (p.169)
-  CWE-81: Improper Neutralization of Script in an Error Message Web Page (p.171)
-  CWE-82: Improper Neutralization of Script in Attributes of IMG Tags in a Web Page (p.174)
-  CWE-83: Improper Neutralization of Script in Attributes in a Web Page (p.175)
-  CWE-84: Improper Neutralization of Encoded URI Schemes in a Web Page (p.178)
-  CWE-85: Doubled Character XSS Manipulations (p.180)
-  CWE-86: Improper Neutralization of Invalid Characters in Identifiers in Web Pages (p.182)
-  CWE-87: Improper Neutralization of Alternate XSS Syntax (p.184)
-  CWE-88: Improper Delimitation of Arguments in a Command ('Argument Injection') (p.186)
-  CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') (p.191)
-  CWE-90: Improper Neutralization of Special Elements used in an LDAP Query ('LDAP Injection') (p.202)
-  CWE-91: XML Injection (aka Blind XPath Injection) (p.204)
-  CWE-93: Improper Neutralization of CRLF Sequences ('CRLF Injection') (p.207)
-  CWE-95: Improper Neutralization of Directives in Dynamically Evaluated Code ('Eval Injection') (p.214)
-  CWE-96: Improper Neutralization of Directives in Statically Saved Code ('Static Code Injection') (p.218)
-  CWE-97: Improper Neutralization of Server-Side Includes (SSI) Within a Web Page (p.222)
-  CWE-99: Improper Control of Resource Identifiers ('Resource Injection') (p.230)
-  CWE-991: SFP Secondary Cluster: Tainted Input to Environment (p.1856)

- B CWE-114: Process Control (p.261)
- B CWE-427: Uncontrolled Search Path Element (p.931)
- B CWE-470: Use of Externally-Controlled Input to Select Classes or Code ('Unsafe Reflection') (p.1004)
- B CWE-471: Modification of Assumed-Immutable Data (MAID) (p.1007)
- B CWE-472: External Control of Assumed-Immutable Web Parameter (p.1009)
- V CWE-473: PHP External Variable Modification (p.1013)
- B CWE-494: Download of Code Without Integrity Check (p.1062)
- V CWE-622: Improper Validation of Function Hook Arguments (p.1243)
- C CWE-673: External Influence of Sphere Definition (p.1325)
- B CWE-94: Improper Control of Generation of Code ('Code Injection') (p.209)
- C CWE-992: SFP Secondary Cluster: Faulty Input Transformation (p.1857)
 - C CWE-116: Improper Encoding or Escaping of Output (p.265)
 - B CWE-166: Improper Handling of Missing Special Element (p.399)
 - B CWE-167: Improper Handling of Additional Special Element (p.401)
 - B CWE-168: Improper Handling of Inconsistent Special Elements (p.403)
 - C CWE-172: Encoding Error (p.408)
 - V CWE-173: Improper Handling of Alternate Encoding (p.411)
 - V CWE-174: Double Decoding of the Same Data (p.412)
 - V CWE-175: Improper Handling of Mixed Encoding (p.415)
 - V CWE-176: Improper Handling of Unicode Encoding (p.416)
 - V CWE-177: Improper Handling of URL Encoding (Hex Encoding) (p.418)
 - B CWE-178: Improper Handling of Case Sensitivity (p.421)
 - B CWE-179: Incorrect Behavior Order: Early Validation (p.424)
 - B CWE-180: Incorrect Behavior Order: Validate Before Canonicalize (p.427)
 - B CWE-181: Incorrect Behavior Order: Validate Before Filter (p.429)
 - B CWE-182: Collapse of Data into Unsafe Value (p.431)
- C CWE-993: SFP Secondary Cluster: Incorrect Input Handling (p.1857)
 - B CWE-198: Use of Incorrect Byte Ordering (p.474)
 - C CWE-228: Improper Handling of Syntactically Invalid Structure (p.526)
 - B CWE-229: Improper Handling of Values (p.528)
 - V CWE-230: Improper Handling of Missing Values (p.529)
 - V CWE-231: Improper Handling of Extra Values (p.530)

 - V CWE-261: Weak Cryptography for Passwords (p.582)
 - V CWE-262: Not Using Password Aging (p.584)
 - B CWE-263: Password Aging with Long Expiration (p.585)
 - B CWE-288: Authentication Bypass Using an Alternate Path or Channel (p.643)
 - B CWE-425: Direct Request ('Forced Browsing') (p.923)
 - V CWE-289: Authentication Bypass by Alternate Name (p.645)
 - B CWE-290: Authentication Bypass by Spoofing (p.647)
 - V CWE-291: Reliance on IP Address for Authentication (p.650)
 - V CWE-293: Using Referer Field for Authentication (p.652)
 - V CWE-350: Reliance on Reverse DNS Resolution for a Security-Critical Action (p.777)
 - B CWE-294: Authentication Bypass by Capture-replay (p.654)
 - B CWE-295: Improper Certificate Validation (p.655)
 - B CWE-296: Improper Following of a Certificate's Chain of Trust (p.660)
 - V CWE-297: Improper Validation of Certificate with Host Mismatch (p.663)
 - V CWE-298: Improper Validation of Certificate Expiration (p.666)
 - B CWE-299: Improper Check for Certificate Revocation (p.668)
 - V CWE-370: Missing Check for Certificate Revocation after Initial Check (p.829)
 - V CWE-599: Missing Validation of OpenSSL Certificate (p.1202)
 - V CWE-301: Reflection Attack in an Authentication Protocol (p.673)
 - V CWE-302: Authentication Bypass by Assumed-Immutable Data (p.675)
 - B CWE-303: Incorrect Implementation of Authentication Algorithm (p.677)

- B CWE-304: Missing Critical Step in Authentication (p.678)
- B CWE-305: Authentication Bypass by Primary Weakness (p.679)
- B CWE-306: Missing Authentication for Critical Function (p.681)
- B CWE-307: Improper Restriction of Excessive Authentication Attempts (p.685)
- B CWE-308: Use of Single-factor Authentication (p.689)
- B CWE-309: Use of Password System for Primary Authentication (p.691)
- B CWE-521: Weak Password Requirements (p.1096)
- V CWE-258: Empty Password in Configuration File (p.574)
- B CWE-522: Insufficiently Protected Credentials (p.1098)
- E CWE-256: Unprotected Storage of Credentials (p.569)
- E CWE-257: Storing Passwords in a Recoverable Format (p.571)
- V CWE-260: Password in Configuration File (p.580)
- V CWE-13: ASP.NET Misconfiguration: Password in Configuration File (p.12)
- V CWE-258: Empty Password in Configuration File (p.574)
- V CWE-523: Unprotected Transport of Credentials (p.1102)
- V CWE-549: Missing Password Field Masking (p.1130)
- V CWE-555: J2EE Misconfiguration: Plaintext Password in Configuration File (p.1137)
- V CWE-593: Authentication Bypass: OpenSSL CTX Object Modified after SSL Objects are Created (p.1193)
- B CWE-603: Use of Client-Side Authentication (p.1214)
- V CWE-620: Unverified Password Change (p.1239)
- B CWE-640: Weak Password Recovery Mechanism for Forgotten Password (p.1264)
- B CWE-645: Overly Restrictive Account Lockout Mechanism (p.1277)
- B CWE-798: Use of Hard-coded Credentials (p.1502)
- E CWE-259: Use of Hard-coded Password (p.575)
- E CWE-321: Use of Hard-coded Cryptographic Key (p.716)
- B CWE-804: Guessable CAPTCHA (p.1511)
- B CWE-836: Use of Password Hash Instead of Password for Authentication (p.1565)
- B CWE-346: Origin Validation Error (p.769)
- C CWE-923: Improper Restriction of Communication Channel to Intended Endpoints (p.1621)
- V CWE-291: Reliance on IP Address for Authentication (p.650)
- V CWE-297: Improper Validation of Certificate with Host Mismatch (p.663)
- C CWE-300: Channel Accessible by Non-Endpoint ('Man-in-the-Middle') (p.670)
- B CWE-322: Key Exchange without Entity Authentication (p.718)
- V CWE-350: Reliance on Reverse DNS Resolution for a Security-Critical Action (p.777)
- B CWE-419: Unprotected Primary Channel (p.916)
- B CWE-420: Unprotected Alternate Channel (p.917)
- E CWE-421: Race Condition During Access to Alternate Channel (p.919)
- V CWE-422: Unprotected Windows Messaging Channel ('Shatter') (p.920)
- V CWE-925: Improper Verification of Intent by Broadcast Receiver (p.1623)
- B CWE-940: Improper Verification of Source of a Communication Channel (p.1634)
- B CWE-941: Incorrectly Specified Destination in a Communication Channel (p.1636)
- V CWE-942: Overly Permissive Cross-domain Whitelist (p.1638)
- B CWE-372: Incomplete Internal State Distinction (p.831)
- C CWE-400: Uncontrolled Resource Consumption (p.871)
- E CWE-770: Allocation of Resources Without Limits or Throttling (p.1436)
- V CWE-774: Allocation of File Descriptors or Handles Without Limits or Throttling (p.1452)
- V CWE-789: Uncontrolled Memory Allocation (p.1488)
- E CWE-771: Missing Reference to Active Allocated Resource (p.1444)
- V CWE-773: Missing Reference to Active File Descriptor or Handle (p.1450)
- E CWE-779: Logging of Excessive Data (p.1461)
- E CWE-920: Improper Restriction of Power Consumption (p.1617)
- C CWE-404: Improper Resource Shutdown or Release (p.885)
- V CWE-262: Not Using Password Aging (p.584)
- E CWE-263: Password Aging with Long Expiration (p.585)

- B CWE-299: Improper Check for Certificate Revocation (p.668)
- V CWE-370: Missing Check for Certificate Revocation after Initial Check (p.829)
- B CWE-459: Incomplete Cleanup (p.987)
- B CWE-226: Sensitive Information Uncleared Before Release (p.524)
 - V CWE-244: Improper Clearing of Heap Memory Before Release ('Heap Inspection') (p.547)
- V CWE-460: Improper Cleanup on Thrown Exception (p.989)
- V CWE-568: finalize() Method Without super.finalize() (p.1155)
- B CWE-763: Release of Invalid Pointer or Reference (p.1422)
 - V CWE-761: Free of Pointer not at Start of Buffer (p.1416)
 - V CWE-762: Mismatched Memory Management Routines (p.1419)
 - V CWE-590: Free of Memory not on the Heap (p.1189)
- B CWE-772: Missing Release of Resource after Effective Lifetime (p.1445)
 - B CWE-1091: Use of Object without Invoking Destructor Method (p.1709)
 - V CWE-401: Missing Release of Memory after Effective Lifetime (p.879)
 - V CWE-775: Missing Release of File Descriptor or Handle after Effective Lifetime (p.1453)
- C CWE-405: Asymmetric Resource Consumption (Amplification) (p.890)
 - B CWE-1050: Excessive Platform Resource Consumption within a Loop (p.1670)
 - B CWE-1072: Data Resource Access without Use of Connection Pooling (p.1691)
 - B CWE-1073: Non-SQL Invokable Control Element with Excessive Number of Data Resource Accesses (p.1692)
 - B CWE-1084: Invokable Control Element with Excessive File or Data Access Operations (p.1702)
 - B CWE-1089: Large Data Table with Excessive Number of Indices (p.1707)
 - B CWE-1094: Excessive Index Range Scan for a Data Resource (p.1712)
 - C CWE-1176: Inefficient CPU Computation (p.1743)
 - V CWE-1042: Static Member Data Element outside of a Singleton Class Element (p.1661)
 - B CWE-1046: Creation of Immutable Text Using String Concatenation (p.1666)
 - B CWE-1049: Excessive Data Query Operations in a Large Data Table (p.1669)
 - B CWE-1063: Creation of Class Instance within a Static Code Block (p.1683)
 - B CWE-1067: Excessive Execution of Sequential Searches of Data Resource (p.1687)
- C CWE-406: Insufficient Control of Network Message Volume (Network Amplification) (p.892)
- C CWE-407: Inefficient Algorithmic Complexity (p.894)
- B CWE-408: Incorrect Behavior Order: Early Amplification (p.896)
- B CWE-409: Improper Handling of Highly Compressed Data (Data Amplification) (p.898)
 - B CWE-776: Improper Restriction of Recursive Entity References in DTDs ('XML Entity Expansion') (p.1454)
- B CWE-410: Insufficient Resource Pool (p.899)
- B CWE-471: Modification of Assumed-Immutable Data (MAID) (p.1007)
 - V CWE-291: Reliance on IP Address for Authentication (p.650)
- B CWE-472: External Control of Assumed-Immutable Web Parameter (p.1009)
 - V CWE-473: PHP External Variable Modification (p.1013)
 - V CWE-607: Public Static Final Field References Mutable Object (p.1218)
- V CWE-487: Reliance on Package-level Scope (p.1046)
- V CWE-488: Exposure of Data Element to Wrong Session (p.1047)
- V CWE-495: Private Data Structure Returned From A Public Method (p.1066)
- V CWE-496: Public Data Assigned to Private Array-Typed Field (p.1068)
- V CWE-498: Cloneable Class Containing Sensitive Information (p.1072)
- V CWE-499: Serializable Class Containing Sensitive Data (p.1074)
- B CWE-501: Trust Boundary Violation (p.1077)
- V CWE-580: clone() Method Without super.clone() (p.1175)
- C CWE-610: Externally Controlled Reference to a Resource in Another Sphere (p.1223)
 - B CWE-15: External Control of System or Configuration Setting (p.16)
 - B CWE-384: Session Fixation (p.847)
 - C CWE-441: Unintended Proxy or Intermediary ('Confused Deputy') (p.958)
 - B CWE-1021: Improper Restriction of Rendered UI Layers or Frames (p.1648)
 - B CWE-918: Server-Side Request Forgery (SSRF) (p.1615)

- B CWE-470: Use of Externally-Controlled Input to Select Classes or Code ('Unsafe Reflection') (p.1004)
- B CWE-601: URL Redirection to Untrusted Site ('Open Redirect') (p.1205)
- B CWE-611: Improper Restriction of XML External Entity Reference (p.1225)
- C CWE-73: External Control of File Name or Path (p.128)
- C CWE-662: Improper Synchronization (p.1300)
 - B CWE-1058: Invokable Control Element in Multi-Thread Context with non-Final Static Storable or Member Element (p.1678)
 - B CWE-663: Use of a Non-reentrant Function in a Concurrent Context (p.1301)
 - V CWE-479: Signal Handler Use of a Non-reentrant Function (p.1028)
 - V CWE-558: Use of getlogin() in Multithreaded Application (p.1138)
 - B CWE-667: Improper Locking (p.1311)
 - B CWE-412: Unrestricted Externally Accessible Lock (p.901)
 - B CWE-413: Improper Resource Locking (p.904)
 - V CWE-591: Sensitive Data Storage in Improperly Locked Memory (p.1192)
 - B CWE-414: Missing Lock Check (p.908)
 - B CWE-609: Double-Checked Locking (p.1221)
 - V CWE-764: Multiple Locks of a Critical Resource (p.1427)
 - B CWE-765: Multiple Unlocks of a Critical Resource (p.1428)
 - B CWE-832: Unlock of a Resource that is not Locked (p.1557)
 - B CWE-833: Deadlock (p.1558)
 - B CWE-820: Missing Synchronization (p.1528)
 - V CWE-1096: Singleton Class Instance Creation without Proper Locking or Synchronization (p.1714)
 - V CWE-543: Use of Singleton Pattern Without Synchronization in a Multithreaded Context (p.1123)
 - B CWE-567: Unsynchronized Access to Shared Data in a Multithreaded Context (p.1152)
 - B CWE-821: Incorrect Synchronization (p.1530)
 - B CWE-1088: Synchronous Access of Remote Resource without Timeout (p.1706)
 - V CWE-572: Call to Thread run() instead of start() (p.1160)
 - V CWE-574: EJB Bad Practices: Use of Synchronization Primitives (p.1164)
- C CWE-665: Improper Initialization (p.1305)
 - B CWE-1051: Initialization with Hard-Coded Network Resource Configuration Data (p.1671)
 - B CWE-1052: Excessive Use of Hard-Coded Literals in Initialization (p.1672)
 - B CWE-1187: Use of Uninitialized Resource (p.1745)
 - B CWE-457: Use of Uninitialized Variable (p.983)
 - B CWE-1188: Insecure Default Initialization of Resource (p.1746)
 - V CWE-453: Insecure Default Variable Initialization (p.974)
 - B CWE-454: External Initialization of Trusted Variables or Data Stores (p.976)
 - B CWE-455: Non-exit on Failed Initialization (p.978)
 - B CWE-770: Allocation of Resources Without Limits or Throttling (p.1436)
 - V CWE-774: Allocation of File Descriptors or Handles Without Limits or Throttling (p.1452)
 - V CWE-789: Uncontrolled Memory Allocation (p.1488)
 - B CWE-909: Missing Initialization of Resource (p.1597)
 - V CWE-456: Missing Initialization of a Variable (p.980)
- C CWE-666: Operation on Resource in Wrong Phase of Lifetime (p.1310)
 - V CWE-415: Double Free (p.909)
 - V CWE-593: Authentication Bypass: OpenSSL CTX Object Modified after SSL Objects are Created (p.1193)
 - B CWE-605: Multiple Binds to the Same Port (p.1215)
 - C CWE-672: Operation on a Resource after Expiration or Release (p.1322)
 - V CWE-298: Improper Validation of Certificate Expiration (p.666)
 - B CWE-324: Use of a Key Past its Expiration Date (p.722)
 - B CWE-613: Insufficient Session Expiration (p.1228)
 - B CWE-825: Expired Pointer Dereference (p.1538)
 - V CWE-415: Double Free (p.909)

- V CWE-416: Use After Free (p.912)
- B CWE-910: Use of Expired File Descriptor (p.1600)
- B CWE-826: Premature Release of Resource During Expected Lifetime (p.1541)
- C CWE-668: Exposure of Resource to Wrong Sphere (p.1316)
- B CWE-134: Use of Externally-Controlled Format String (p.340)
- C CWE-200: Information Exposure (p.475)
 - V CWE-201: Information Exposure Through Sent Data (p.482)
 - B CWE-203: Information Exposure Through Discrepancy (p.485)
 - B CWE-204: Response Discrepancy Information Exposure (p.489)
 - B CWE-205: Information Exposure Through Behavioral Discrepancy (p.492)
 - V CWE-206: Information Exposure of Internal State Through Behavioral Inconsistency (p.493)
 - V CWE-207: Information Exposure Through an External Behavioral Inconsistency (p.494)
 - B CWE-208: Information Exposure Through Timing Discrepancy (p.495)
 - B CWE-209: Information Exposure Through an Error Message (p.497)
 - B CWE-210: Information Exposure Through Self-generated Error Message (p.503)
 - V CWE-535: Information Exposure Through Shell Error Message (p.1114)
 - V CWE-536: Information Exposure Through Servlet Runtime Error Message (p.1115)
 - V CWE-537: Information Exposure Through Java Runtime Error Message (p.1116)
 - B CWE-211: Information Exposure Through Externally-Generated Error Message (p.504)
 - V CWE-550: Information Exposure Through Server Error Message (p.1131)
 - B CWE-212: Improper Cross-boundary Removal of Sensitive Data (p.506)
 - B CWE-213: Intentional Information Exposure (p.509)
 - V CWE-214: Information Exposure Through Process Environment (p.511)
 - V CWE-215: Information Exposure Through Debug Information (p.513)
 - V CWE-11: ASP.NET Misconfiguration: Creating Debug Binary (p.9)
 - B CWE-226: Sensitive Information Uncleared Before Release (p.524)
 - V CWE-244: Improper Clearing of Heap Memory Before Release ('Heap Inspection') (p.547)
 - C CWE-359: Exposure of Private Information ('Privacy Violation') (p.796)
 - V CWE-202: Exposure of Sensitive Data Through Data Queries (p.484)
 - V CWE-497: Exposure of System Data to an Unauthorized Control Sphere (p.1069)
 - V CWE-524: Information Exposure Through Caching (p.1103)
 - V CWE-525: Information Exposure Through Browser Caching (p.1104)
 - V CWE-526: Information Exposure Through Environmental Variables (p.1105)
 - B CWE-538: File and Directory Information Exposure (p.1118)
 - V CWE-527: Exposure of CVS Repository to an Unauthorized Control Sphere (p.1106)
 - V CWE-528: Exposure of Core Dump File to an Unauthorized Control Sphere (p.1107)
 - V CWE-529: Exposure of Access Control List Files to an Unauthorized Control Sphere (p.1108)
 - V CWE-530: Exposure of Backup File to an Unauthorized Control Sphere (p.1109)
 - V CWE-532: Inclusion of Sensitive Information in Log Files (p.1111)
 - V CWE-539: Information Exposure Through Persistent Cookies (p.1120)
 - V CWE-540: Information Exposure Through Source Code (p.1121)
 - V CWE-531: Information Exposure Through Test Code (p.1110)
 - V CWE-541: Information Exposure Through Include Source Code (p.1122)
 - V CWE-615: Information Exposure Through Comments (p.1231)
 - V CWE-548: Information Exposure Through Directory Listing (p.1129)
 - V CWE-651: Information Exposure Through WSDL File (p.1287)
 - V CWE-598: Information Exposure Through Query Strings in GET Request (p.1201)
 - V CWE-612: Information Exposure Through Indexing of Private Data (p.1227)
 - B CWE-22: Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal') (p.31)
 - B CWE-23: Relative Path Traversal (p.41)
 - V CWE-24: Path Traversal: '../filedir' (p.48)

- B CWE-248: Uncaught Exception (p.552)
- B CWE-600: Uncaught Exception in Servlet (p.1204)
- B CWE-274: Improper Handling of Insufficient Privileges (p.610)
- V CWE-333: Improper Handling of Insufficient Entropy in TRNG (p.748)
- B CWE-391: Unchecked Error Condition (p.857)
- B CWE-392: Missing Report of Error Condition (p.860)
- B CWE-393: Return of Wrong Status Code (p.862)
- B CWE-397: Declaration of Throws for Generic Exception (p.869)
- C CWE-754: Improper Check for Unusual or Exceptional Conditions (p.1394)
 - B CWE-252: Unchecked Return Value (p.560)
 - B CWE-253: Incorrect Check of Function Return Value (p.567)
 - B CWE-273: Improper Check for Dropped Privileges (p.608)
 - B CWE-354: Improper Validation of Integrity Check Value (p.790)
 - B CWE-394: Unexpected Status Code or Return Value (p.863)
 - B CWE-476: NULL Pointer Dereference (p.1017)
 - B CWE-690: Unchecked Return Value to NULL Pointer Dereference (p.1352)
- C CWE-755: Improper Handling of Exceptional Conditions (p.1402)
 - B CWE-209: Information Exposure Through an Error Message (p.497)
 - B CWE-210: Information Exposure Through Self-generated Error Message (p.503)
 - V CWE-535: Information Exposure Through Shell Error Message (p.1114)
 - V CWE-536: Information Exposure Through Servlet Runtime Error Message (p.1115)
 - V CWE-537: Information Exposure Through Java Runtime Error Message (p.1116)
 - B CWE-211: Information Exposure Through Externally-Generated Error Message (p.504)
 - V CWE-550: Information Exposure Through Server Error Message (p.1131)
 - B CWE-280: Improper Handling of Insufficient Permissions or Privileges (p.619)
 - C CWE-390: Detection of Error Condition Without Action (p.853)
 - B CWE-395: Use of NullPointerException Catch to Detect NULL Pointer Dereference (p.865)
 - B CWE-396: Declaration of Catch for Generic Exception (p.867)
 - V CWE-460: Improper Cleanup on Thrown Exception (p.989)
 - B CWE-544: Missing Standardized Error Handling Mechanism (p.1125)
 - C CWE-636: Not Failing Securely ('Failing Open') (p.1256)
 - B CWE-455: Non-exit on Failed Initialization (p.978)
 - C CWE-756: Missing Custom Error Page (p.1404)
 - V CWE-12: ASP.NET Misconfiguration: Missing Custom Error Page (p.10)
 - V CWE-7: J2EE Misconfiguration: Missing Custom Error Page (p.4)
- C CWE-707: Improper Enforcement of Message or Data Structure (p.1375)
- C CWE-116: Improper Encoding or Escaping of Output (p.265)
 - B CWE-117: Improper Output Neutralization for Logs (p.272)
 - V CWE-644: Improper Neutralization of HTTP Headers for Scripting Syntax (p.1276)
 - B CWE-838: Inappropriate Encoding for Output Context (p.1567)
- C CWE-138: Improper Neutralization of Special Elements (p.348)
 - B CWE-140: Improper Neutralization of Delimiters (p.351)
 - V CWE-141: Improper Neutralization of Parameter/Argument Delimiters (p.353)

- V CWE-142: Improper Neutralization of Value Delimiters (p.355)
- V CWE-143: Improper Neutralization of Record Delimiters (p.356)
- V CWE-144: Improper Neutralization of Line Delimiters (p.358)
- V CWE-145: Improper Neutralization of Section Delimiters (p.360)
- V CWE-146: Improper Neutralization of Expression/Command Delimiters (p.362)
- V CWE-147: Improper Neutralization of Input Terminators (p.364)
- V CWE-148: Improper Neutralization of Input Leaders (p.366)
- V CWE-149: Improper Neutralization of Quoting Syntax (p.367)
- V CWE-150: Improper Neutralization of Escape, Meta, or Control Sequences (p.369)
- V CWE-151: Improper Neutralization of Comment Delimiters (p.372)
- V CWE-152: Improper Neutralization of Macro Symbols (p.374)
- V CWE-153: Improper Neutralization of Substitution Characters (p.375)
- V CWE-154: Improper Neutralization of Variable Name Delimiters (p.377)
- V CWE-155: Improper Neutralization of Wildcards or Matching Symbols (p.379)
- V CWE-56: Path Equivalence: 'filedir*' (Wildcard) (p.104)
- V CWE-156: Improper Neutralization of Whitespace (p.381)
- V CWE-157: Failure to Sanitize Paired Delimiters (p.383)
- V CWE-158: Improper Neutralization of Null Byte or NUL Character (p.385)
- C CWE-159: Failure to Sanitize Special Element (p.387)
- B CWE-166: Improper Handling of Missing Special Element (p.399)
- B CWE-167: Improper Handling of Additional Special Element (p.401)
- B CWE-168: Improper Handling of Inconsistent Special Elements (p.403)
- V CWE-160: Improper Neutralization of Leading Special Elements (p.389)
- V CWE-161: Improper Neutralization of Multiple Leading Special Elements (p.391)
 - V CWE-50: Path Equivalence: '//multiple/leading/slash' (p.96)
 - V CWE-37: Path Traversal: '/absolute/pathname/here' (p.74)
- V CWE-162: Improper Neutralization of Trailing Special Elements (p.393)
- V CWE-163: Improper Neutralization of Multiple Trailing Special Elements (p.394)
 - V CWE-43: Path Equivalence: 'filename....' (Multiple Trailing Dot) (p.89)
 - V CWE-52: Path Equivalence: '/multiple/trailing/slash/' (p.99)
 - V CWE-42: Path Equivalence: 'filename.' (Trailing Dot) (p.88)
 - V CWE-43: Path Equivalence: 'filename....' (Multiple Trailing Dot) (p.89)
 - V CWE-46: Path Equivalence: 'filename ' (Trailing Space) (p.92)
 - V CWE-49: Path Equivalence: 'filename/' (Trailing Slash) (p.95)
 - V CWE-54: Path Equivalence: 'filedir\' (Trailing Backslash) (p.101)
- V CWE-164: Improper Neutralization of Internal Special Elements (p.396)
- V CWE-165: Improper Neutralization of Multiple Internal Special Elements (p.398)
 - V CWE-45: Path Equivalence: 'file...name' (Multiple Internal Dot) (p.91)
 - V CWE-53: Path Equivalence: '\multiple\internal\backslash' (p.100)
- B CWE-464: Addition of Data Structure Sentinel (p.995)
- C CWE-790: Improper Filtering of Special Elements (p.1491)
- B CWE-791: Incomplete Filtering of Special Elements (p.1493)
 - V CWE-792: Incomplete Filtering of One or More Instances of Special Elements (p.1494)
 - V CWE-793: Only Filtering One Instance of a Special Element (p.1495)
 - V CWE-794: Incomplete Filtering of Multiple Instances of Special Elements (p.1497)
 - B CWE-795: Only Filtering Special Elements at a Specified Location (p.1498)
 - V CWE-796: Only Filtering Special Elements Relative to a Marker (p.1499)
 - V CWE-797: Only Filtering Special Elements at an Absolute Position (p.1501)
- B CWE-170: Improper Null Termination (p.404)
- C CWE-172: Encoding Error (p.408)
 - V CWE-173: Improper Handling of Alternate Encoding (p.411)
 - V CWE-174: Double Decoding of the Same Data (p.412)
 - V CWE-175: Improper Handling of Mixed Encoding (p.415)
 - V CWE-176: Improper Handling of Unicode Encoding (p.416)
 - V CWE-177: Improper Handling of URL Encoding (Hex Encoding) (p.418)

- C CWE-228: Improper Handling of Syntactically Invalid Structure (p.526)
 - B CWE-229: Improper Handling of Values (p.528)
 - V CWE-230: Improper Handling of Missing Values (p.529)
 - V CWE-231: Improper Handling of Extra Values (p.530)
 - V CWE-232: Improper Handling of Undefined Values (p.531)
 - B CWE-233: Improper Handling of Parameters (p.532)
 - V CWE-234: Failure to Handle Missing Parameter (p.534)
 - V CWE-235: Improper Handling of Extra Parameters (p.536)
 - V CWE-236: Improper Handling of Undefined Parameters (p.537)
 - B CWE-237: Improper Handling of Structural Elements (p.538)
 - V CWE-238: Improper Handling of Incomplete Structural Elements (p.539)
 - V CWE-239: Failure to Handle Incomplete Element (p.540)
 - B CWE-240: Improper Handling of Inconsistent Structural Elements (p.541)
 - E CWE-130: Improper Handling of Length Parameter Inconsistency (p.327)
 - B CWE-241: Improper Handling of Unexpected Data Type (p.542)
- B CWE-240: Improper Handling of Inconsistent Structural Elements (p.541)
 - B CWE-130: Improper Handling of Length Parameter Inconsistency (p.327)
- B CWE-463: Deletion of Data Structure Sentinel (p.993)
- G CWE-74: Improper Neutralization of Special Elements in Output Used by a Downstream Component ('Injection') (p.133)
 - C CWE-75: Failure to Sanitize Special Elements into a Different Plane (Special Element Injection) (p.137)
 - B CWE-76: Improper Neutralization of Equivalent Special Elements (p.138)
 - C CWE-77: Improper Neutralization of Special Elements used in a Command ('Command Injection') (p.139)
 - B CWE-624: Executable Regular Expression Error (p.1246)
 - B CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p.144)
 - B CWE-88: Improper Delimitation of Arguments in a Command ('Argument Injection') (p.186)
 - B CWE-917: Improper Neutralization of Special Elements used in an Expression Language Statement ('Expression Language Injection') (p.1614)
 - B CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') (p.156)
 - E CWE-692: Incomplete Blacklist to Cross-Site Scripting (p.1356)
 - V CWE-80: Improper Neutralization of Script-Related HTML Tags in a Web Page (Basic XSS) (p.169)
 - V CWE-81: Improper Neutralization of Script in an Error Message Web Page (p.171)
 - V CWE-83: Improper Neutralization of Script in Attributes in a Web Page (p.175)
 - V CWE-82: Improper Neutralization of Script in Attributes of IMG Tags in a Web Page (p.174)
 - V CWE-84: Improper Neutralization of Encoded URI Schemes in a Web Page (p.178)
 - V CWE-85: Doubled Character XSS Manipulations (p.180)
 - V CWE-86: Improper Neutralization of Invalid Characters in Identifiers in Web Pages (p.182)
 - V CWE-87: Improper Neutralization of Alternate XSS Syntax (p.184)
 - B CWE-91: XML Injection (aka Blind XPath Injection) (p.204)
 - B CWE-643: Improper Neutralization of Data within XPath Expressions ('XPath Injection') (p.1274)
 - B CWE-652: Improper Neutralization of Data within XQuery Expressions ('XQuery Injection') (p.1289)
 - B CWE-93: Improper Neutralization of CRLF Sequences ('CRLF Injection') (p.207)
 - B CWE-113: Improper Neutralization of CRLF Sequences in HTTP Headers ('HTTP Response Splitting') (p.256)
 - B CWE-94: Improper Control of Generation of Code ('Code Injection') (p.209)
 - V CWE-95: Improper Neutralization of Directives in Dynamically Evaluated Code ('Eval Injection') (p.214)
 - B CWE-96: Improper Neutralization of Directives in Statically Saved Code ('Static Code Injection') (p.218)

- V CWE-97: Improper Neutralization of Server-Side Includes (SSI) Within a Web Page (p.222)
- C CWE-943: Improper Neutralization of Special Elements in Data Query Logic (p.1641)
 - B CWE-643: Improper Neutralization of Data within XPath Expressions ('XPath Injection') (p.1274)
 - B CWE-652: Improper Neutralization of Data within XQuery Expressions ('XQuery Injection') (p.1289)
 - B CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') (p.191)
 - V CWE-564: SQL Injection: Hibernate (p.1147)
 - B CWE-90: Improper Neutralization of Special Elements used in an LDAP Query ('LDAP Injection') (p.202)
- B CWE-99: Improper Control of Resource Identifiers ('Resource Injection') (p.230)
 - B CWE-641: Improper Restriction of Names for Files and Other Resources (p.1266)
 - B CWE-694: Use of Multiple Resources with Duplicate Identifier (p.1359)
 - V CWE-102: Struts: Duplicate Validation Forms (p.233)
 - B CWE-462: Duplicate Key in Associative List (Alist) (p.991)
- B CWE-914: Improper Control of Dynamically-Identified Variables (p.1605)
 - B CWE-621: Variable Extraction Error (p.1241)
 - B CWE-627: Dynamic Variable Evaluation (p.1251)
- C CWE-710: Improper Adherence to Coding Standards (p.1378)
 - B CWE-1041: Use of Redundant Code (p.1660)
 - B CWE-1044: Architecture with Number of Horizontal Layers Outside of Expected Range (p.1663)
 - B CWE-1048: Invokable Control Element with Large Number of Outward Calls (p.1668)
- C CWE-1059: Incomplete Documentation (p.1678)
 - B CWE-1053: Missing Documentation for Design (p.1673)
 - B CWE-1110: Incomplete Design Documentation (p.1726)
 - B CWE-1111: Incomplete I/O Documentation (p.1727)
 - B CWE-1112: Incomplete Documentation of Program Execution (p.1727)
 - B CWE-1118: Insufficient Documentation of Error Handling Techniques (p.1732)
- C CWE-1061: Insufficient Encapsulation (p.1680)
 - B CWE-1054: Invocation of a Control Element at an Unnecessarily Deep Horizontal Layer (p.1674)
 - B CWE-1057: Data Access Operations Outside of Expected Data Manager Component (p.1676)
 - B CWE-1062: Parent Class with References to Child Class (p.1682)
 - B CWE-1083: Data Access from Outside Expected Data Manager Component (p.1701)
 - B CWE-1090: Method Containing Access of a Member Element from Another Class (p.1708)
 - B CWE-1100: Insufficient Isolation of System-Dependent Functions (p.1718)
 - B CWE-1105: Insufficient Encapsulation of Machine-Dependent Functionality (p.1722)
 - B CWE-188: Reliance on Data/Memory Layout (p.444)
 - B CWE-198: Use of Incorrect Byte Ordering (p.474)
 - V CWE-766: Critical Data Element Declared Public (p.1429)
- B CWE-1065: Runtime Resource Management Control Element in a Component Built to Run on Application Servers (p.1685)
- B CWE-1066: Missing Serialization Control Element (p.1686)
- B CWE-1068: Inconsistency Between Implementation and Documented Design (p.1687)
- V CWE-107: Struts: Unused Validation Form (p.245)
- B CWE-1070: Serializable Data Element Containing non-Serializable Item Elements (p.1689)
- C CWE-1076: Insufficient Adherence to Expected Conventions (p.1695)
 - V CWE-1045: Parent Class with a Virtual Destructor and a Child Class without a Virtual Destructor (p.1665)
- C CWE-1078: Inappropriate Source Code Style or Formatting (p.1697)
 - B CWE-1085: Invokable Control Element with Excessive Volume of Commented-out Code (p.1704)
 - B CWE-1099: Inconsistent Naming Conventions for Identifiers (p.1717)
 - B CWE-1106: Insufficient Use of Symbolic Constants (p.1723)
 - B CWE-1107: Insufficient Isolation of Symbolic Constant Definitions (p.1724)
 - B CWE-1109: Use of Same Variable for Multiple Purposes (p.1725)

- B CWE-1113: Inappropriate Comment Style (p.1728)
- B CWE-1114: Inappropriate Whitespace Style (p.1729)
- B CWE-1115: Source Code Element without Standard Prologue (p.1730)
- B CWE-1116: Inaccurate Comments (p.1730)
- B CWE-1117: Callable with Insufficient Behavioral Summary (p.1731)
- V CWE-546: Suspicious Comment (p.1126)
- V CWE-547: Use of Hard-coded, Security-relevant Constants (p.1127)
- B CWE-1079: Parent Class without Virtual Destructor Method (p.1698)
- B CWE-1082: Class Instance Self Destruction Control Element (p.1700)
- B CWE-1087: Class with Virtual Method without a Virtual Destructor (p.1706)
- B CWE-1091: Use of Object without Invoking Destructor Method (p.1709)
- B CWE-1097: Persistent Storable Data Element without Associated Comparison Control Element (p.1715)
- V CWE-1098: Data Element containing Pointer Item without Proper Copy Control Element (p.1716)
- B CWE-1108: Excessive Reliance on Global Variables (p.1725)
- V CWE-586: Explicit Call to Finalize() (p.1183)
- B CWE-1092: Use of Same Invokable Control Element in Multiple Architectural Layers (p.1710)
- G CWE-1093: Excessively Complex Data Representation (p.1711)
- B CWE-1043: Data Element Aggregating an Excessively Large Number of Non-Primitive Elements (p.1662)
- B CWE-1055: Multiple Inheritance from Concrete Classes (p.1675)
- B CWE-1074: Class with Excessively Deep Inheritance (p.1693)
- B CWE-1086: Class with Excessive Number of Child Classes (p.1705)
- V CWE-110: Struts: Validator Without Form Field (p.250)
- B CWE-1101: Reliance on Runtime Component in Generated Code (p.1719)
- B CWE-1104: Use of Unmaintained Third Party Components (p.1721)
- G CWE-1120: Excessive Code Complexity (p.1734)
- B CWE-1047: Modules with Circular Dependencies (p.1667)
- B CWE-1056: Invokable Control Element with Variadic Parameters (p.1675)
- B CWE-1060: Excessive Number of Inefficient Server-Side Data Accesses (p.1679)
- B CWE-1064: Invokable Control Element with Signature Containing an Excessive Number of Parameters (p.1684)
- B CWE-1075: Unconditional Control Flow Transfer outside of Switch Block (p.1694)
- B CWE-1080: Source Code File with Excessive Number of Lines of Code (p.1699)
- B CWE-1095: Loop Condition Value Update within the Loop (p.1713)
- B CWE-1119: Excessive Use of Unconditional Branching (p.1733)
- B CWE-1121: Excessive McCabe Cyclomatic Complexity (p.1735)
- B CWE-1122: Excessive Halstead Complexity (p.1736)
- B CWE-1123: Excessive Use of Self-Modifying Code (p.1737)
- B CWE-1124: Excessively Deep Nesting (p.1737)
- B CWE-1125: Excessive Attack Surface (p.1738)
- B CWE-1126: Declaration of Variable with Unnecessarily Wide Scope (p.1739)
- B CWE-1127: Compilation with Insufficient Warnings or Errors (p.1740)
- G CWE-1164: Irrelevant Code (p.1740)
- V CWE-1071: Empty Code Block (p.1690)
- V CWE-1069: Empty Exception Block (p.1688)
- V CWE-585: Empty Synchronized Block (p.1182)
- B CWE-561: Dead Code (p.1141)
- V CWE-563: Assignment to Variable without Use (p.1146)
- G CWE-1177: Use of Prohibited Code (p.1744)
- B CWE-242: Use of Inherently Dangerous Function (p.544)
- B CWE-676: Use of Potentially Dangerous Function (p.1329)
- V CWE-785: Use of Path Manipulation Function without Maximum-sized Buffer (p.1473)
- B CWE-476: NULL Pointer Dereference (p.1017)
- B CWE-690: Unchecked Return Value to NULL Pointer Dereference (p.1352)

- B CWE-477: Use of Obsolete Function (p.1022)
- B CWE-484: Omitted Break Statement in Switch (p.1041)
- B CWE-489: Leftover Debug Code (p.1049)
- C CWE-506: Embedded Malicious Code (p.1083)
 - B CWE-507: Trojan Horse (p.1085)
 - B CWE-508: Non-Replicating Malicious Code (p.1087)
 - B CWE-509: Replicating Malicious Code (Virus or Worm) (p.1088)
 - B CWE-510: Trapdoor (p.1089)
 - B CWE-511: Logic/Time Bomb (p.1090)
 - B CWE-512: Spyware (p.1091)
- V CWE-570: Expression is Always False (p.1156)
- V CWE-571: Expression is Always True (p.1159)
- C CWE-573: Improper Following of Specification by Caller (p.1162)
 - V CWE-103: Struts: Incomplete validate() Method Definition (p.235)
 - V CWE-104: Struts: Form Bean Does Not Extend Validation Class (p.237)
 - V CWE-243: Creation of chroot Jail Without Changing Working Directory (p.545)
 - B CWE-253: Incorrect Check of Function Return Value (p.567)
 - B CWE-296: Improper Following of a Certificate's Chain of Trust (p.660)
 - B CWE-304: Missing Critical Step in Authentication (p.678)
 - B CWE-325: Missing Required Cryptographic Step (p.723)
 - V CWE-329: Not Using a Random IV with CBC Mode (p.736)
 - B CWE-358: Improperly Implemented Security Check for Standard (p.795)
 - B CWE-475: Undefined Behavior for Input to API (p.1016)
 - V CWE-568: finalize() Method Without super.finalize() (p.1155)
 - V CWE-577: EJB Bad Practices: Use of Sockets (p.1170)
 - V CWE-578: EJB Bad Practices: Use of Class Loader (p.1172)
 - V CWE-579: J2EE Bad Practices: Non-serializable Object Stored in Session (p.1174)
 - V CWE-580: clone() Method Without super.clone() (p.1175)
 - B CWE-581: Object Model Violation: Just One of Equals and Hashcode Defined (p.1176)
 - B CWE-628: Function Call with Incorrectly Specified Arguments (p.1253)
 - V CWE-683: Function Call With Incorrect Order of Arguments (p.1342)
 - V CWE-685: Function Call With Incorrect Number of Arguments (p.1345)
 - V CWE-686: Function Call With Incorrect Argument Type (p.1346)
 - V CWE-687: Function Call With Incorrectly Specified Argument Value (p.1348)
 - V CWE-560: Use of umask() with chmod-style Argument (p.1140)
 - V CWE-688: Function Call With Incorrect Variable or Reference as Argument (p.1349)
- C CWE-675: Duplicate Operations on Resource (p.1328)
 - V CWE-174: Double Decoding of the Same Data (p.412)
 - V CWE-415: Double Free (p.909)
 - B CWE-605: Multiple Binds to the Same Port (p.1215)
 - V CWE-764: Multiple Locks of a Critical Resource (p.1427)
 - B CWE-765: Multiple Unlocks of a Critical Resource (p.1428)
- B CWE-694: Use of Multiple Resources with Duplicate Identifier (p.1359)
 - V CWE-102: Struts: Duplicate Validation Forms (p.233)

 - V CWE-337: Predictable Seed in Pseudo-Random Number Generator (PRNG) (p.755)
 - G CWE-400: Uncontrolled Resource Consumption (p.871)
 - V CWE-401: Missing Release of Memory after Effective Lifetime (p.879)
 - B CWE-770: Allocation of Resources Without Limits or Throttling (p.1436)
 - B CWE-798: Use of Hard-coded Credentials (p.1502)
- C CWE-1153: SEI CERT Oracle Secure Coding Standard for Java - Guidelines 50. Android (DRD) (p.1893)
- C CWE-1175: SEI CERT Oracle Secure Coding Standard for Java - Guidelines 18. Concurrency (CON) (p.1904)

Graph View: CWE-1154: Weaknesses Addressed by the SEI CERT C Coding Standard

- C** CWE-1155: SEI CERT C Coding Standard - Guidelines 01. Preprocessor (PRE) (p.1894)
- C** CWE-1156: SEI CERT C Coding Standard - Guidelines 02. Declarations and Initialization (DCL) (p.1894)
 - B** CWE-562: Return of Stack Variable Address (p.1144)
- C** CWE-1157: SEI CERT C Coding Standard - Guidelines 03. Expressions (EXP) (p.1895)
 - G** CWE-758: Reliance on Undefined, Unspecified, or Implementation-Defined Behavior (p.1406)
 - B** CWE-908: Use of Uninitialized Resource (p.1594)
 - B** CWE-476: NULL Pointer Dereference (p.1017)
 - B** CWE-690: Unchecked Return Value to NULL Pointer Dereference (p.1352)
 - B** CWE-628: Function Call with Incorrectly Specified Arguments (p.1253)
 - V** CWE-685: Function Call With Incorrect Number of Arguments (p.1345)
 - V** CWE-686: Function Call With Incorrect Argument Type (p.1346)
 - B** CWE-843: Access of Resource Using Incompatible Type ('Type Confusion') (p.1579)
 - G** CWE-704: Incorrect Type Conversion or Cast (p.1370)
 - G** CWE-119: Improper Restriction of Operations within the Bounds of a Memory Buffer (p.276)
 - B** CWE-125: Out-of-bounds Read (p.307)
 - B** CWE-480: Use of Incorrect Operator (p.1031)
 - V** CWE-481: Assigning instead of Comparing (p.1034)
- C** CWE-1158: SEI CERT C Coding Standard - Guidelines 04. Integers (INT) (p.1895)
 - B** CWE-190: Integer Overflow or Wraparound (p.446)
 - B** CWE-131: Incorrect Calculation of Buffer Size (p.331)
 - B** CWE-191: Integer Underflow (Wrap or Wraparound) (p.453)
 - B** CWE-680: Integer Overflow to Buffer Overflow (p.1333)
 - V** CWE-192: Integer Coercion Error (p.455)
 - B** CWE-197: Numeric Truncation Error (p.471)
 - B** CWE-681: Incorrect Conversion between Numeric Types (p.1334)
 - G** CWE-704: Incorrect Type Conversion or Cast (p.1370)
 - V** CWE-194: Unexpected Sign Extension (p.463)
 - V** CWE-195: Signed to Unsigned Conversion Error (p.466)
 - B** CWE-369: Divide By Zero (p.826)
 - G** CWE-682: Incorrect Calculation (p.1338)
 - G** CWE-758: Reliance on Undefined, Unspecified, or Implementation-Defined Behavior (p.1406)
 - B** CWE-587: Assignment of a Fixed Address to a Pointer (p.1185)
- C** CWE-1159: SEI CERT C Coding Standard - Guidelines 05. Floating Point (FLP) (p.1896)
 - G** CWE-682: Incorrect Calculation (p.1338)
 - B** CWE-391: Unchecked Error Condition (p.857)
 - B** CWE-681: Incorrect Conversion between Numeric Types (p.1334)
 - B** CWE-197: Numeric Truncation Error (p.471)
- C** CWE-1160: SEI CERT C Coding Standard - Guidelines 06. Arrays (ARR) (p.1896)
 - G** CWE-119: Improper Restriction of Operations within the Bounds of a Memory Buffer (p.276)
 - B** CWE-129: Improper Validation of Array Index (p.318)
 - B** CWE-786: Access of Memory Location Before Start of Buffer (p.1475)
 - B** CWE-123: Write-what-where Condition (p.301)
 - B** CWE-125: Out-of-bounds Read (p.307)
 - G** CWE-758: Reliance on Undefined, Unspecified, or Implementation-Defined Behavior (p.1406)
 - B** CWE-469: Use of Pointer Subtraction to Determine Size (p.1002)
 - V** CWE-121: Stack-based Buffer Overflow (p.295)
 - B** CWE-805: Buffer Access with Incorrect Length Value (p.1513)
 - B** CWE-468: Incorrect Pointer Scaling (p.1001)
- C** CWE-1161: SEI CERT C Coding Standard - Guidelines 07. Characters and Strings (STR) (p.1897)
 - B** CWE-120: Buffer Copy without Checking Size of Input ('Classic Buffer Overflow') (p.286)
 - G** CWE-119: Improper Restriction of Operations within the Bounds of a Memory Buffer (p.276)

- V CWE-121: Stack-based Buffer Overflow (p.295)
- V CWE-122: Heap-based Buffer Overflow (p.298)
- B CWE-123: Write-what-where Condition (p.301)
- B CWE-125: Out-of-bounds Read (p.307)
- B CWE-676: Use of Potentially Dangerous Function (p.1329)
- B CWE-170: Improper Null Termination (p.404)
- C CWE-704: Incorrect Type Conversion or Cast (p.1370)
- C CWE-1162: SEI CERT C Coding Standard - Guidelines 08. Memory Management (MEM) (p.1898)
 - V CWE-416: Use After Free (p.912)
 - C CWE-672: Operation on a Resource after Expiration or Release (p.1322)
 - C CWE-758: Reliance on Undefined, Unspecified, or Implementation-Defined Behavior (p.1406)
 - C CWE-666: Operation on Resource in Wrong Phase of Lifetime (p.1310)
 - V CWE-415: Double Free (p.909)
 - V CWE-401: Missing Release of Memory after Effective Lifetime (p.879)
 - C CWE-404: Improper Resource Shutdown or Release (p.885)
 - B CWE-459: Incomplete Cleanup (p.987)
 - B CWE-771: Missing Reference to Active Allocated Resource (p.1444)
 - B CWE-772: Missing Release of Resource after Effective Lifetime (p.1445)
 - V CWE-590: Free of Memory not on the Heap (p.1189)
 - B CWE-131: Incorrect Calculation of Buffer Size (p.331)
 - C CWE-680: Integer Overflow to Buffer Overflow (p.1333)
 - V CWE-467: Use of sizeof() on a Pointer Type (p.998)
 - V CWE-789: Uncontrolled Memory Allocation (p.1488)
 - B CWE-190: Integer Overflow or Wraparound (p.446)
- C CWE-1163: SEI CERT C Coding Standard - Guidelines 09. Input Output (FIO) (p.1899)
 - B CWE-134: Use of Externally-Controlled Format String (p.340)
 - C CWE-20: Improper Input Validation (p.18)
 - V CWE-67: Improper Handling of Windows Device Names (p.122)
 - B CWE-197: Numeric Truncation Error (p.471)
 - B CWE-241: Improper Handling of Unexpected Data Type (p.542)
 - C CWE-664: Improper Control of a Resource Through its Lifetime (p.1303)
 - C CWE-404: Improper Resource Shutdown or Release (p.885)
 - B CWE-459: Incomplete Cleanup (p.987)
 - B CWE-772: Missing Release of Resource after Effective Lifetime (p.1445)
 - V CWE-773: Missing Reference to Active File Descriptor or Handle (p.1450)
 - V CWE-775: Missing Release of File Descriptor or Handle after Effective Lifetime (p.1453)
 - B CWE-771: Missing Reference to Active Allocated Resource (p.1444)
 - B CWE-910: Use of Expired File Descriptor (p.1600)
 - C CWE-666: Operation on Resource in Wrong Phase of Lifetime (p.1310)
 - C CWE-672: Operation on a Resource after Expiration or Release (p.1322)
 - C CWE-758: Reliance on Undefined, Unspecified, or Implementation-Defined Behavior (p.1406)
 - V CWE-686: Function Call With Incorrect Argument Type (p.1346)
 - V CWE-685: Function Call With Incorrect Number of Arguments (p.1345)
- C CWE-1165: SEI CERT C Coding Standard - Guidelines 10. Environment (ENV) (p.1899)
 - C CWE-705: Incorrect Control Flow Scoping (p.1372)
 - B CWE-676: Use of Potentially Dangerous Function (p.1329)
 - B CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p.144)
 - B CWE-88: Improper Delimitation of Arguments in a Command ('Argument Injection') (p.186)
- C CWE-1166: SEI CERT C Coding Standard - Guidelines 11. Signals (SIG) (p.1900)
 - V CWE-479: Signal Handler Use of a Non-reentrant Function (p.1028)
 - C CWE-662: Improper Synchronization (p.1300)
- C CWE-1167: SEI CERT C Coding Standard - Guidelines 12. Error Handling (ERR) (p.1900)
 - V CWE-456: Missing Initialization of a Variable (p.980)

- B CWE-391: Unchecked Error Condition (p.857)
- B CWE-252: Unchecked Return Value (p.560)
- B CWE-253: Incorrect Check of Function Return Value (p.567)
- B CWE-676: Use of Potentially Dangerous Function (p.1329)
- G CWE-758: Reliance on Undefined, Unspecified, or Implementation-Defined Behavior (p.1406)
- C CWE-1168: SEI CERT C Coding Standard - Guidelines 13. Application Programming Interfaces (API) (p.1901)
- C CWE-1169: SEI CERT C Coding Standard - Guidelines 14. Concurrency (CON) (p.1901)
 - B CWE-667: Improper Locking (p.1311)
 - B CWE-366: Race Condition within a Thread (p.817)
 - B CWE-676: Use of Potentially Dangerous Function (p.1329)
 - G CWE-330: Use of Insufficiently Random Values (p.738)
 - B CWE-377: Insecure Temporary File (p.837)
- C CWE-1170: SEI CERT C Coding Standard - Guidelines 48. Miscellaneous (MSC) (p.1902)
 - G CWE-327: Use of a Broken or Risky Cryptographic Algorithm (p.727)
 - G CWE-330: Use of Insufficiently Random Values (p.738)
 - B CWE-338: Use of Cryptographically Weak Pseudo-Random Number Generator (PRNG) (p.756)
 - B CWE-676: Use of Potentially Dangerous Function (p.1329)
 - B CWE-331: Insufficient Entropy (p.744)
 - G CWE-758: Reliance on Undefined, Unspecified, or Implementation-Defined Behavior (p.1406)
- C CWE-1171: SEI CERT C Coding Standard - Guidelines 50. POSIX (POS) (p.1902)
 - B CWE-170: Improper Null Termination (p.404)
 - B CWE-242: Use of Inherently Dangerous Function (p.544)
 - B CWE-363: Race Condition Enabling Link Following (p.809)
 - G CWE-696: Incorrect Behavior Order (p.1361)
 - B CWE-273: Improper Check for Dropped Privileges (p.608)
 - B CWE-667: Improper Locking (p.1311)
 - B CWE-391: Unchecked Error Condition (p.857)
 - B CWE-252: Unchecked Return Value (p.560)
 - B CWE-253: Incorrect Check of Function Return Value (p.567)
- C CWE-1172: SEI CERT C Coding Standard - Guidelines 51. Microsoft Windows (WIN) (p.1903)
 - V CWE-762: Mismatched Memory Management Routines (p.1419)
 - C CWE-227: 7PK - API Abuse (p.1752)
 - V CWE-590: Free of Memory not on the Heap (p.1189)

Graph View: CWE-1178: Weaknesses Addressed by the SEI CERT Perl Coding Standard

- C** CWE-1179: SEI CERT Perl Coding Standard - Guidelines 01. Input Validation and Data Sanitization (IDS) (*p. 1904*)
- C** CWE-1180: SEI CERT Perl Coding Standard - Guidelines 02. Declarations and Initialization (DCL) (*p. 1904*)
- C** CWE-1181: SEI CERT Perl Coding Standard - Guidelines 03. Expressions (EXP) (*p. 1905*)
- C** CWE-1182: SEI CERT Perl Coding Standard - Guidelines 04. Integers (INT) (*p. 1905*)
- C** CWE-1183: SEI CERT Perl Coding Standard - Guidelines 05. Strings (STR) (*p. 1906*)
- C** CWE-1184: SEI CERT Perl Coding Standard - Guidelines 06. Object-Oriented Programming (OOP) (*p. 1906*)
- C** CWE-1185: SEI CERT Perl Coding Standard - Guidelines 07. File Input and Output (FIO) (*p. 1906*)
- C** CWE-1186: SEI CERT Perl Coding Standard - Guidelines 50. Miscellaneous (MSC) (*p. 1907*)

Graph View: CWE-1200: Weaknesses in the 2019 CWE Top 25 Most Dangerous Software Errors

-  CWE-119: Improper Restriction of Operations within the Bounds of a Memory Buffer (p.276)
-  CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') (p.156)
-  CWE-20: Improper Input Validation (p.18)
-  CWE-200: Information Exposure (p.475)
-  CWE-125: Out-of-bounds Read (p.307)
-  CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') (p.191)
-  CWE-416: Use After Free (p.912)
-  CWE-190: Integer Overflow or Wraparound (p.446)
-  CWE-352: Cross-Site Request Forgery (CSRF) (p.782)
-  CWE-22: Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal') (p.31)
-  CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p.144)
-  CWE-787: Out-of-bounds Write (p.1478)
-  CWE-287: Improper Authentication (p.637)
-  CWE-476: NULL Pointer Dereference (p.1017)
-  CWE-732: Incorrect Permission Assignment for Critical Resource (p.1380)
-  CWE-434: Unrestricted Upload of File with Dangerous Type (p.944)
-  CWE-611: Improper Restriction of XML External Entity Reference (p.1225)
-  CWE-94: Improper Control of Generation of Code ('Code Injection') (p.209)
-  CWE-798: Use of Hard-coded Credentials (p.1502)
-  CWE-400: Uncontrolled Resource Consumption (p.871)
-  CWE-772: Missing Release of Resource after Effective Lifetime (p.1445)
-  CWE-426: Untrusted Search Path (p.926)
-  CWE-502: Deserialization of Untrusted Data (p.1079)
-  CWE-269: Improper Privilege Management (p.595)
-  CWE-295: Improper Certificate Validation (p.655)

Deprecated

CWE-1: DEPRECATED: Location

CWE ID : 1

Status: Deprecated

Summary

This category has been deprecated. It was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

CWE-3: DEPRECATED: Technology-specific Environment Issues

CWE ID : 3

Status: Deprecated

Summary

This category has been deprecated. It was originally intended as a "catch-all" for environment issues for technologies that did not have their own CWE, but it introduced unnecessary depth and complexity to the Development View (CWE-699).

CWE-10: DEPRECATED: ASP.NET Environment Issues

CWE ID : 10

Status: Deprecated

Summary

This category has been deprecated. It added unnecessary depth and complexity to its associated views.

CWE-17: DEPRECATED: Code

CWE ID : 17

Status: Deprecated

Summary

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

CWE-18: DEPRECATED: Source Code

CWE ID : 18

Status: Deprecated

Summary

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

CWE-60: DEPRECATED: UNIX Path Link Problems

CWE ID : 60

Status: Deprecated

Summary

This category has been deprecated. It covered a very low level of abstraction based on operating system, which was not useful for any existing view.

CWE-63: DEPRECATED: Windows Path Link Problems

CWE ID : 63

Status: Deprecated

Summary

This category has been deprecated. It covered a very low level of abstraction based on operating system, which was not useful for any existing view.

CWE-68: DEPRECATED: Windows Virtual File Problems

CWE ID : 68

Status: Deprecated

Summary

This category has been deprecated as it was found to be an unnecessary abstraction of platform specific details. Please refer to the category CWE-632 and weakness CWE-66 for relevant relationships.

CWE-70: DEPRECATED: Mac Virtual File Problems

CWE ID : 70

Status: Deprecated

Summary

This category has been deprecated as it was found to be an unnecessary abstraction of platform specific details. Please refer to the category CWE-632 and weakness CWE-66 for relevant relationships.

CWE-71: DEPRECATED: Apple '.DS_Store'

CWE ID : 71

Status: Deprecated

Description

This entry has been deprecated as it represents a specific observed example of a UNIX Hard Link weakness type rather than its own individual weakness type. Please refer to CWE-62.

CWE-92: DEPRECATED: Improper Sanitization of Custom Special Characters

CWE ID : 92

Status: Deprecated

Description

2048

This entry has been deprecated. It originally came from PLOVER, which sometimes defined "other" and "miscellaneous" categories in order to satisfy exhaustiveness requirements for taxonomies. Within the context of CWE, the use of a more abstract entry is preferred in mapping situations. CWE-75 is a more appropriate mapping.

CWE-100: DEPRECATED: Technology-Specific Input Validation Problems

CWE ID : 100

Status: Deprecated

Summary

This category has been deprecated. It was originally intended as a "catch-all" for input validation problems in technologies that did not have their own CWE, but introduces unnecessary depth to the hierarchy.

CWE-101: DEPRECATED: Struts Validation Problems

CWE ID : 101

Status: Deprecated

Summary

This category has been deprecated. It was originally used for organizing the Development View (CWE-69 9), but it introduced unnecessary complexity and depth to the resulting tree.

CWE-132: DEPRECATED (Duplicate): Miscalculated Null Termination

CWE ID : 132

Status: Deprecated

Description

This entry has been deprecated because it was a duplicate of CWE-170. All content has been transferred to CWE-170.

CWE-139: DEPRECATED: General Special Element Problems

CWE ID : 139

Status: Deprecated

Summary

This entry has been deprecated. It is a leftover from PLOVER, but CWE-138 is a more appropriate mapping.

CWE-169: DEPRECATED: Technology-Specific Special Elements

CWE ID : 169

Status: Deprecated

Summary

This category has been deprecated. It was originally intended as a "catch-all" for input validation problems in technologies that did not have their own CWE, but introduces unnecessary depth to the hierarchy.

CWE-217: DEPRECATED: Failure to Protect Stored Data from Modification

CWE ID : 217

Status: Deprecated

Description

This weakness has been deprecated because it incorporated and confused multiple weaknesses. The issues formerly covered in this weakness can be found at CWE-766 and CWE-767.

CWE-218: DEPRECATED (Duplicate): Failure to provide confidentiality for stored data

CWE ID : 218

Status: Deprecated

Description

This weakness has been deprecated because it was a duplicate of CWE-493. All content has been transferred to CWE-493.

CWE-225: DEPRECATED (Duplicate): General Information Management Problems

CWE ID : 225

Status: Deprecated

Description

This weakness can be found at CWE-199.

CWE-247: DEPRECATED (Duplicate): Reliance on DNS Lookups in a Security Decision

CWE ID : 247

Status: Deprecated

Description

This entry has been deprecated because it was a duplicate of CWE-350. All content has been transferred to CWE-350.

CWE-249: DEPRECATED: Often Misused: Path Manipulation

CWE ID : 249

Status: Deprecated

Description

This entry has been deprecated because of name confusion and an accidental combination of multiple weaknesses. Most of its content has been transferred to CWE-785.

CWE-292: DEPRECATED (Duplicate): Trusting Self-reported DNS Name

CWE ID : 292

Status: Deprecated

Description

This entry has been deprecated because it was a duplicate of CWE-350. All content has been transferred to CWE-350.

CWE-373: DEPRECATED: State Synchronization Error

CWE ID : 373

Status: Deprecated

Description

This entry was deprecated because it overlapped the same concepts as race condition (CWE-362) and Improper Synchronization (CWE-662).

CWE-418: DEPRECATED: Channel Errors

CWE ID : 418

Status: Deprecated

Summary

This category has been deprecated because it redundant with the grouping provided by CWE-417.

CWE-423: DEPRECATED (Duplicate): Proxied Trusted Channel

CWE ID : 423

Status: Deprecated

Description

This entry has been deprecated because it was a duplicate of CWE-441. All content has been transferred to CWE-441.

CWE-443: DEPRECATED (Duplicate): HTTP response splitting

CWE ID : 443

Status: Deprecated

Description

This weakness can be found at CWE-113.

CWE-445: DEPRECATED: User Interface Errors

CWE ID : 445

Status: Deprecated

Summary

This weakness has been deprecated because it was a duplicate of CWE-355. All content has been transferred to CWE-355.

CWE-458: DEPRECATED: Incorrect Initialization

CWE ID : 458

Status: Deprecated

Description

This weakness has been deprecated because its name and description did not match. The description duplicated CWE-454, while the name suggested a more abstract initialization problem. Please refer to CWE-665 for the more abstract problem.

CWE-503: DEPRECATED: Byte/Object Code

CWE ID : 503 Status: Deprecated

Summary

This category has been deprecated. It was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

CWE-504: DEPRECATED: Motivation/Intent

CWE ID : 504 Status: Deprecated

Summary

This category has been deprecated. It was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

CWE-505: DEPRECATED: Intentionally Introduced Weakness

CWE ID : 505 Status: Deprecated

Summary

This category has been deprecated as it was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

CWE-513: DEPRECATED: Intentionally Introduced Nonmalicious Weakness

CWE ID : 513 Status: Deprecated

Summary

This category has been deprecated as it was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

CWE-516: DEPRECATED (Duplicate): Covert Timing Channel

CWE ID : 516 Status: Deprecated

Description

This weakness can be found at CWE-385.

CWE-517: DEPRECATED: Other Intentional, Nonmalicious Weakness

CWE ID : 517

Status: Deprecated

Summary

This category has been deprecated as it was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

CWE-518: DEPRECATED: Inadvertently Introduced Weakness

CWE ID : 518

Status: Deprecated

Summary

This category has been deprecated as it was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

CWE-533: DEPRECATED: Information Exposure Through Server Log Files

CWE ID : 533

Status: Deprecated

Description

This entry has been deprecated because its abstraction was too low-level. See CWE-532.

CWE-534: DEPRECATED: Information Exposure Through Debug Log Files

CWE ID : 534

Status: Deprecated

Description

This entry has been deprecated because its abstraction was too low-level. See CWE-532.

CWE-542: DEPRECATED: Information Exposure Through Cleanup Log Files

CWE ID : 542

Status: Deprecated

Description

This entry has been deprecated because its abstraction was too low-level. See CWE-532.

CWE-545: DEPRECATED: Use of Dynamic Class Loading

CWE ID : 545

Status: Deprecated

Description

This weakness has been deprecated because it partially overlaps CWE-470, it describes legitimate programmer behavior, and other portions will need to be integrated into other entries.

CWE-592: DEPRECATED: Authentication Bypass Issues

CWE ID : 592

Status: Deprecated

Description

This weakness has been deprecated because it covered redundant concepts already described in CWE-287.

CWE-596: DEPRECATED: Incorrect Semantic Object Comparison

CWE ID : 596

Status: Deprecated

Description

This weakness has been deprecated. It was poorly described and difficult to distinguish from other entries. It was also inappropriate to assign a separate ID solely because of domain-specific considerations. Its closest equivalent is CWE-1023.

CWE-630: DEPRECATED: Weaknesses Examined by SAMATE

CWE ID : 630

Status: Deprecated

Objective

This view has been deprecated. It was only used for an early year of the NIST SAMATE project, and it did not represent any official or commonly-utilized list.

CWE-631: DEPRECATED: Resource-specific Weaknesses

CWE ID : 631

Status: Deprecated

Objective

This view has been deprecated because it is not actively maintained and does not provide utility to stakeholders. It was originally created before CWE 1.0 as a simple example of how views could be structured within CWE.

CWE-632: DEPRECATED: Weaknesses that Affect Files or Directories

CWE ID : 632

Status: Deprecated

Summary

This category has been deprecated. It was not actively maintained, and it was not useful to stakeholders. It was originally created before CWE 1.0 as part of view CWE-631, which was a simple example of how views could be structured within CWE.

CWE-633: DEPRECATED: Weaknesses that Affect Memory

CWE ID : 633

Status: Deprecated

Summary

This category has been deprecated. It was not actively maintained, and it was not useful to stakeholders. It was originally created before CWE 1.0 as part of view CWE-631, which was a simple example of how views could be structured within CWE.

CWE-634: DEPRECATED: Weaknesses that Affect System Processes

CWE ID : 634

Status: Deprecated

Summary

This category has been deprecated. It was not actively maintained, and it was not useful to stakeholders. It was originally created before CWE 1.0 as part of view CWE-631, which was a simple example of how views could be structured within CWE.

CWE-679: DEPRECATED: Chain Elements

CWE ID : 679

Status: Deprecated

Objective

This view has been deprecated. It has limited utility for stakeholders, since all weaknesses can be links in a chain.

CWE-769: DEPRECATED: Uncontrolled File Descriptor Consumption

CWE ID : 769

Status: Deprecated

Description

This entry has been deprecated because it was a duplicate of CWE-774. All content has been transferred to CWE-774.
